Virtual Disk Wizard
Virtual Hard Disk Options
The Linked to a hard disk option is advanced.
Select a virtual hard disk option:
Dynamically expanding (Recommended)
The size of this virtual hard disk expands to a fixed maximum size as data is saved to it. The disk size does not compact automatically when data is deleted. To compact the disk size, edit the disk using this wizard.
Fixed size
This virtual hard disk uses a fixed amount of space, regardless of the amount of data stored on it. Its default size is the maximum amount of space available on your physical hard disk.
Differencing
This virtual hard disk is based on an existing virtual hard disk configuration. Only changes are stored to the differencing virtual hard disk.
Linked to a hard disk (Advanced)
This virtual hard disk links to a hard disk on the physical computer
< Back
Next >
Cancel

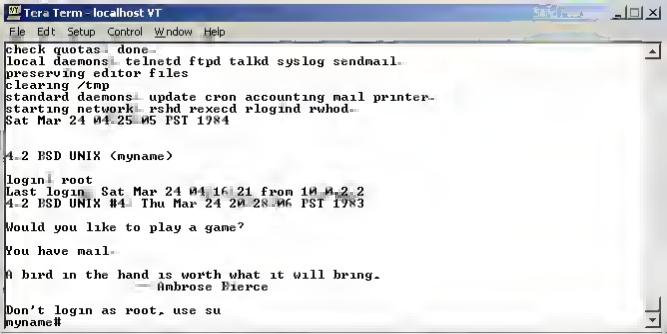

Virtual Disk Wizard
Physical Hard Disks
You can select the hard disk on the physical computer to which the virtual hard disk will link.
The Admin Services will map hard disks on your physical computer that the virtual machine can access. Physical hard disks with mounted volumes are read only. If you want read/write access to a hard disk on the physical computer, select it and then clear the Read only check box.
To link the virtual hard disk to the physical hard disk, select a physical hard disk and then click Next.

>?
WELCOME TO ADUENTURE!? WOULD YOU LIKE INSTRUCTIONS?
> Y
SOMEWHERE NEARBY IS COLOSSAL CAVE, WHERE OTHERS HAVE FOUND FORTUNES
IN TREASURE AND GOLD,THOUGH IT IS RUMORED THAT SOME WHO ENTER ARE NEVER
SEEN AGAIN. MAGIC IS SAID TO WORK IN THE CAVE. I WILL BE YOUR EYES
AND HANDS. DIRECT ME WITH COMMANDS OF 1 OR 2 WORDS. I SHOULD WARN
YOU THAT I LOOK AT ONLY THE FIRST FOUR LETTERS OF EACH WORD,SO YOU'LL
HAVE TO ENTER "NORTHEAST" AS "NE" TO DISTINGUISH IT FROM "NORTH".
(SHOULD YOU GET STUCK, TYPE "HELP" FOR SOME GENERAL HINTS. FOR
INFORMATION ON HOW TO END YOUR ADUENTURE, ETC., TYPE "INFO".)
THIS PROGRAM WAS ORIGINALLY DEUELOPED BY WILLIE CROWTHER. MOST OF
THE FEATURES OF THE CURRENT PROGRAM WERE ADDED BY DON WOODS.
THIS UERSION, FOR THE PDP-8, WAS DONE BY DICK MURPHY. IT IS
BASED ON A UERSION FOR PDP-11 DONE BY BOB SUPNIK.
YOU ARE STANDING AT THE END OF A ROAD BEFORE A SMALL BRICK BUILDING.
AROUND YOU IS A FOREST. A SMALL STREAM FLOWS OUT OF THE BUILDING AND
DOWN A GULLY.

Take advantage of distributed client-server technology with Microsoft® SQL Server for the Windows NT™ operating system. It's the high-end database platform that delivers line-of-business solutions on today's corporate networks—all within a powerful, reliable, and open client-server architecture that builds on your computing investment.

Power to deliver demanding client-server solutions.

- *High performance design.* Access up to 2 gigabytes of memory and multiple terabytes of disk storage through a powerful 32-bit architecture.
- *Scalable Symmetric Server Architecture.* Assure a high degree of scalability across a range of Intel® and RISC single-processor or multiprocessor hardware by balancing user tasks dynamically across processors.
- *System management.* Install, configure, and administer SQL Server for Windows NT with minimal effort, locally or remotely using the graphical tools.

Reliability your business can trust.

- *Robust transaction processing.* Ensure data integrity and reliability, with automatic recovery in case of system failure.
- *High availability.* Keep systems up and running with database mirroring and online, unattended backups.
- *Centralized data integrity.* Manage integrity centrally with stored procedures and triggers, and build business rules into the server, for consistent, reliable information.

Openness to protect your computing investment.

- *Application and development tools.* Works with hundreds of client-server applications and development tools available for the MS-DOS® Microsoft Windows™ Microsoft Windows NT, and OS/2® operating systems using DB-Library™ or the Microsoft Open Database Connectivity (ODBC) interface.
- *Network integration.* Operates smoothly with popular networks and protocols, including UNIX® environments.
- *Open interfaces and gateways.* Accesses host database systems—such as IBM® DB2®—through third-party gateways or those you develop using Microsoft Open Data Services.

Microsoft SQL Server for Windows NT is based on the SYBASE database server.

Alone wrested the Turtish.
Yet that is the treasure of Doom as Dungeons here! A wish to point.
Yet that is the treasure of wish-of Doom.
You were level 7 with a maximum of 70 hits point when you died.

Microsoft Windows NT™

Package contains 3.5" high-density disks; a CD-ROM disc; and a coupon for 5.25" high-density disks.

Microsoft WINDOWS NT

Operating System Version 3.1

Add networking with a mouse click as you connect to local network resources throughout the enterprise.

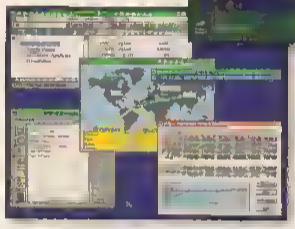

Today's increasing demands on people in the workplace call for an operating system that is powerful, reliable, and open. Welcome to Microsoft® Windows NT™—the advanced operating system for client/server computing, designed to make the most of today's powerful machines.

Keep working, even when downloading a file. Windows NT uses idle system resources, allowing for fast response when running multiple applications.

Run multiple 32-bit Windows® and MS-DOS® high-performance graphics applications.

Manage files and directories easily. Use long filenames, too, for quick identification.

Windows NT can also play for those who prefer to use applications you need—your business. Plus, it allows you to work with leading personal productivity applications—all on one desktop.

Protect your data with built-in security and integrated security features.

Windows NT's most powerful.

- *32-bit:* Run thousands of applications designed for the Microsoft Windows® operating system, including new high-performance 32-bit applications.
- *Preemptive multitasking:* Work on multiple tasks simultaneously and move easily from one to another.
- *High capacity:* Access more memory—up to 2 GB of virtual memory per application.
- *Scalable:* Runs on a range of Intel®, RISC, and symmetric multiprocessing systems.
- *Connectivity:* Built-in networking lets you access information and resources, even across multivendor environments.

Reliable performance and data protection

- *Continuous operation:* The Windows NT operating system keeps running, even if one of your applications doesn't.
- *Power failure protection:* Integrates with uninterruptible power supplies to protect against power failure.
- *Built-in backup:* Provides an extensible, easy-to-use, hardware-independent backup utility.

Open, scalable design

- *Application support:* Runs 32-bit applications designed especially for Windows NT, along with applications for the MS-DOS® operating system, Windows 3.1, POSIX, and character-based OS/2 1.x.
- *Hardware:* Supports a wide range of popular systems and peripherals.
- *Integration:* Works with popular networking and communications software.

Windows NT is the high-end member of the Windows family of operating systems, designed to make the most of today's powerful machines.

6489 Part No. 36336

System requirements:

x86-based system

- Personal computer using a 386/25 or higher microprocessor
- 12 MB of memory (recommended minimum)
- One high-density disk drive and a hard disk with 75 MB of free space
- VGA, Super VGA, or video graphics adapter compatible with Microsoft Windows NT 3.1
- Optional: One Windows NT compatible CD-ROM drive

RISC-based system

- Windows NT—compatible RISC-based system
- 16 MB of memory minimum
- One Microsoft Windows NT–compatible CD-ROM drive and a hard disk with 92 MB of free space
- VGA, Super VGA, or video graphics adapter compatible with Microsoft Windows NT 3.1

Note: Software is packaged to be used with one or two processors.

Options:

- Microsoft Mouse or compatible pointing device (mouse recommended)
- Network adapter card
- Audio board
- Hayes® or compatible modem

Networking options:

Microsoft Windows NT is supported on the following networks:

- Banyan® VINES®
- DEC® Pathworks™
- IBM® LAN Server
- IBM SNA networks™
- Microsoft LAN Manager
- Microsoft Windows® for Workgroups
- Novell® NetWare®
- TCP/IP networks

Requires additional software.

Now with MFC 3.0 and support for 32-bit OLE

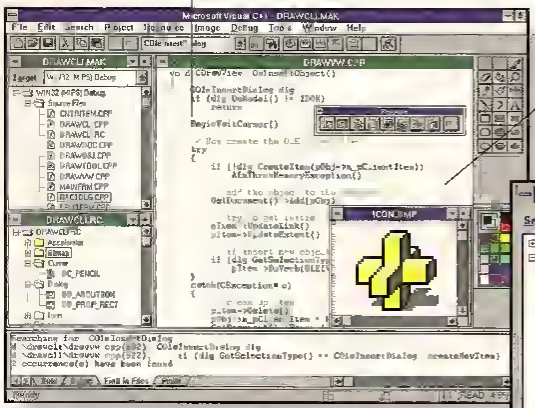

It's happened. RISC processors have emerged as a powerful alternative to other 32-bit processors, yet they run the same Windows-based applications. A compelling new class of applications is possible, using advanced 32-bit technology like OLE 2.0 and multithreading. And there's no faster way to deliver them—on a variety of platforms—than with the Microsoft® Visual C++™ development system version 2.0.

Have everything your way. Put what you need exactly where you need it, using customizable toolbars. You can even use the improved debugging windows like toolbars—floating or docked to the side of the IDE, but always visible.

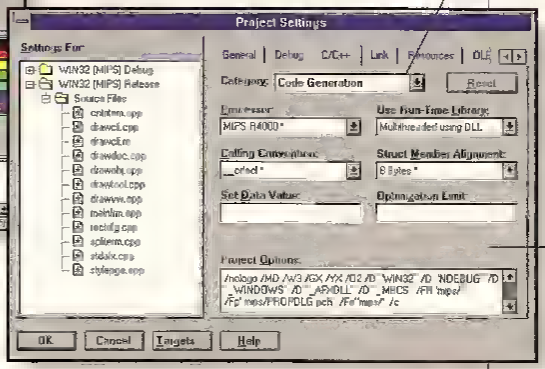

See quickly the function of each button in Visual C++

Drag-and-drop editing brings the usability-tested productivity of other Microsoft applications to Visual C++

Use the latest C/C++ language features, such as templates and exceptions.

Browse and set build options at the project, group, or file level with property pages

You can even save customized compiler options for each source file and then group files with common build options to streamline complex projects

Be in two places at once. You can edit while you build, browse while you debug, and jump to class definitions immediately, because the resource editor, code editor, browser windows, project window, and debugger are all integrated. And wizards link you to the latest advances of the Microsoft Foundation Class Library, making it easy to develop high-performance applications that take advantage of 32-bit object linking and embedding (OLE) 2.0 functionality.

Shorten your learning curve. The integrated development environment (IDE) in Visual C++ has the same familiar interface when you target MIPS processors, yet is tailored for RISC programming. Customize large builds using project settings to select multithreading, alignment options, and C++ optimizations for specific processors.

System requirements:

- MIPS®-based personal computer running Microsoft Windows NT™ Workstation operating system version 3.5 or later
- 16 MB of memory (20 MB recommended)
- One CD-ROM drive
- Hard disk space required
  - Minimum installation when used with a CD-ROM drive: 29 MB
  - Typical installation: 98 MB
- A VGA or higher-resolution monitor
- Microsoft Mouse or compatible pointing device

© 1994 Microsoft Corporation. All rights reserved. Made in the United States of America.

Company names and/or data used in screens are fictitious, unless otherwise noted.

Visual C++™

RISC Edition

Development System for RISC Processors Version 4.0

RISC Based for Windows NT™ Workstation

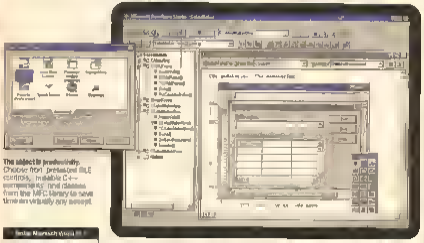

Microsoft®

Visual C++

RISC Edition

Take Visual C++ to the next generation of processors.

A compelling new class of applications is now possible, using advanced 32-bit technology like OLE, OpenGL, graphics and multithreading. And now you can deliver these on the fastest processors available with the Microsoft® Visual C++™, RISC Edition, development system

- Productivity: Simplify object-oriented programming with an object-centric environment that features ClassView class management tool, WizardBar object navigation tool, and integrated debugger and resource editor.
- MFC: Use the latest advances in the Microsoft Foundation Class Library to create 32-bit OLE support and powerful database applications using ODBC.

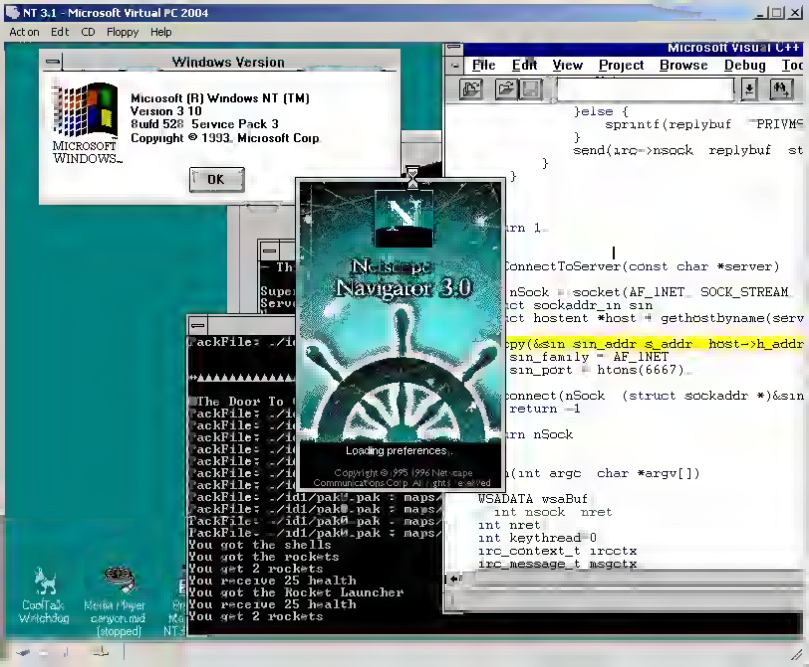

Expand your installation and leverage your skills. Use the Cross Development Edition for Macintosh as a ready-now opportunities in software for the Macintosh.

PLANETFALL
Infocom interactive fiction - a science fiction story
Copyright (c) 1983 by Infocom, Inc. All rights reserved.
PLANETFALL is a trademark of Infocom, Inc.
Release 37 / Serial number 851003
Another routine day of drudgery aboard the Stellar Patrol Ship Feinstein. This morning's assignment for a certain lowly Ensign Seventh Class: scrubbing the filthy metal deck at the port end of Level Nine. With your Patrol-issue self-contained multi-purpose all-weather scrub brush you shine the floor with a diligence born of the knowledge that at any moment dreaded Ensign First Class Blather, the bane of your shipboard existence, could appear.
Deck Nine
This is a featureless corridor similar to every other corridor on the ship. It curves away to starboard, and a gangway leads up. To port is the entrance to one of the ship's primary escape pods. The pod bulkhead is closed.

Heuristic reasoning is reasoning not regarded as final and strict but as provisional and plausible only, whose purpose is to discover the solution of the present problem. We are often obliged to use heuristic reasoning. We shall attain complete certainty when we shall have obtained the complete solution, but before obtaining certainty we must often be satisfied with a more or less plausible guess. We may need the provisional before we attain the final.

fortune
There is a theory which states that if ever anyone discovers exactly what the Universe is for and why it is here, it will instantly disappear and be replaced by something even more bizarre and inexplicable.
There is another theory which states that this has already happened.

C:\Windows\system32\cmd.exe
C:\msys\1.0\src\adv350kp>advent.exe
Welcome to Adventure** Would you like instructions?
>no
You are standing at the end of a road before a small brick building.
Around you is a forest. A small stream flows out of the building and
down a gully.
>quit
Do you really want to quit now?
>y
Ok
You scored 32 out of a possible 350, using 1 turns.
You are obviously a Rank Amateur. Better luck next time.
To achieve the next higher rating, you need 4 more points.
STOP statement executed

Imagine the speed and power of a $100,000 minicomputer in a desktop PC costing under $7,000. Now imagine all that power going to waste because the operating system you chose was never meant to take advantage of a computer this powerful. It will take more than just a "window environment" or an outdated operating system to unlock the 80386.

It will take PC-MOS/386™.

The First 80386 Operating System. Specifically designed for the 80386 computer, PC-MOS/386™ opens doors. Doors to more memory and multi-tasking. Doors to thousands of DOS programs as well as upcoming 80386-specific software. It's the *gateway* to the latest technology—, and your networking future.

Memory Management Without Boards. PC MOS exploits the memory management capabilities built into the 80386. So, up to four GIGABYTES of memory are accessible to multiple users and to future 80386-specific applications requiring megabytes of memory.

Multi-Tasking, Multi-User Support for One, Five or 25 Users. PC-MOS/386™ allows up to 25 inexpensive terminals to be driven by a single 80386 machine. So the features of the 80386 can be utilized at every terminal. And it comes in three versions so you can upgrade your system as your company grows, without having to learn new commands or install new hardware.

UP TO 25 USERS.

MADE FOR THE 80386.

RUNS DOS PROGRAMS.

MULTI-TASKING

Software Support for Thousands of DOS Programs. Although PC-MOS/386™ totally replaces DOS, it doesn't make you replace your favorite DOS programs. So you can run programs like Lotus 1-2-3, WordStar, dBASE III, and WordPerfect on the 80386. Best of all, it uses familiar commands like DIR and COPY—so you'll feel comfortable with our system.

The Gateway to Endless Features. Distinctive characteristics like file/system security, remote access, file/record locking, and built-in color graphics support for EACH user set PC-MOS/386™ apart from all previous operating systems.

Open the Doors to Your Future TODAY! Call The Software Link TODAY for more information and the authorized dealer nearest you. PC-MOS/386™ comes in single, five & 25-user versions starting at $195.

                Welcome to Dungeon.

   Dungeon is a game of adventure, danger, and low cunning.  In it
you will explore some of the most amazing territory ever seen by mortal
man.  Hardened adventurers have run screaming from the terrors contained
within.

   In Dungeon, the intrepid explorer delves into the forgotten secrets
of a lost labyrinth deep in the bowels of the earth, searching for
vast treasures long hidden from prying eyes, treasures guarded by
fearsome monsters and diabolical traps.

   Dungeon was created at the Programming Technology Division of the MIT
Laboratory for Computer Science by Tim Anderson, Marc Blank, Bruce
Daniels, and Dave Lebling.  It was based on the original ideas of
Crowther and Woods, and the Dungeons and Dragons game of Gygax
and Arneson.  The original version was written in MDL (alias MUDDLE).
The current version was translated from MDL into FORTRAN IV by
a somewhat paranoid DEC engineer who prefers to remain anonymous.

   On-line information may be obtained with the commands HELP and INFO.

The Internet Explorer 6 Countdown

Moving the world off Internet Explorer 6

Windows Internet Explorer

Download Now

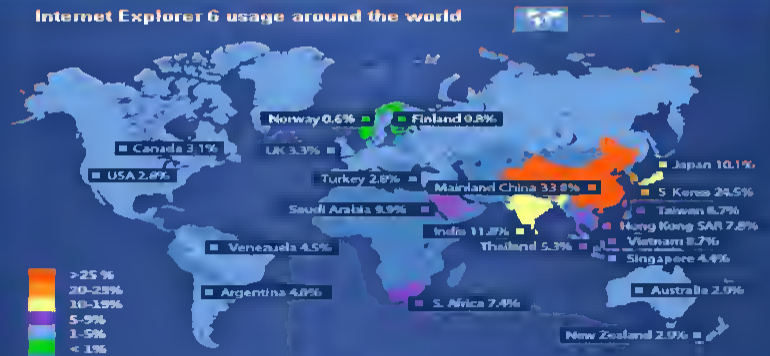

You are using an outdated version of Internet Explorer. For a faster, safer browsing experience. UPGRADE TODAY

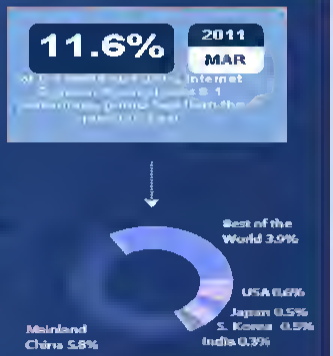

10 years ago a browser was born.

Its name was Internet Explorer 6. Now that we're in 2011, in an era of modern web standards, **it's time to say goodbye.**

This website is dedicated to watching Internet Explorer 6 usage drop to **less than 1% worldwide**, so more websites can choose to drop support for Internet Explorer 6, saving hours of work for web developers.

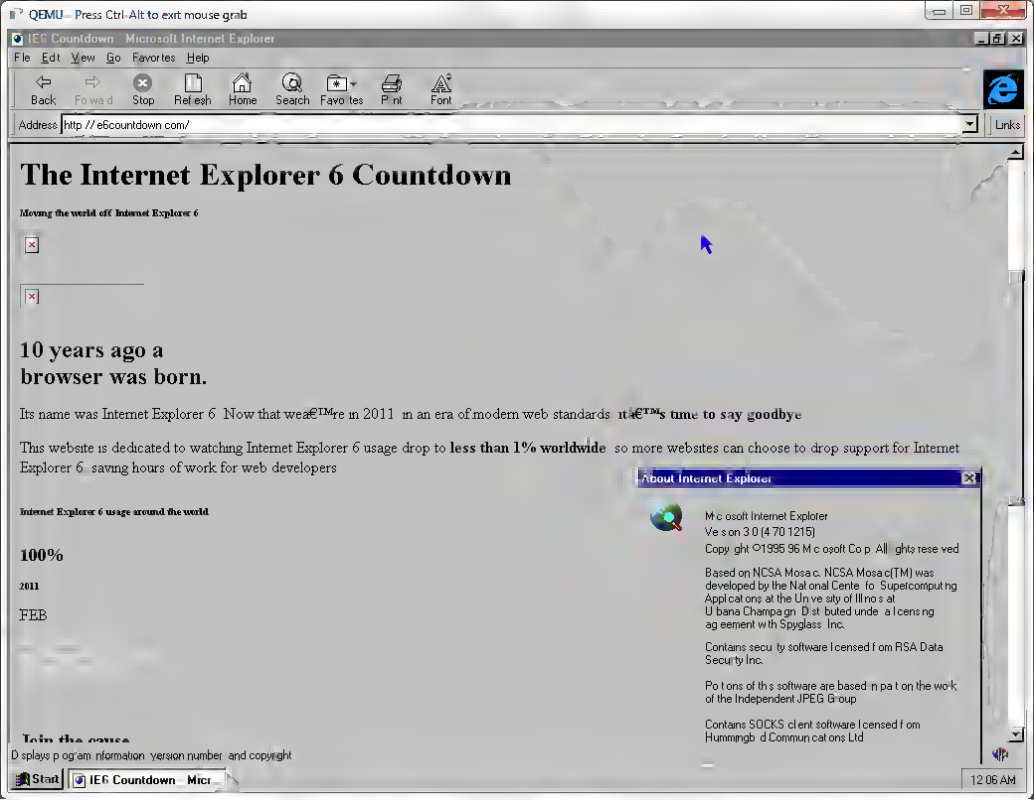

Here's what you can do.

You are now in single-user mode while booted from a CD-ROM
Since the root disk is read-only, some commands may not work as
they normally do. In particular, commands that try to create
files in /tmp will probably fail. One way to avoid this problem
is to mount a separate hard disk or floppy on /tmp using the
mount command. For example, "/sbin/mount /dev/fd0a /tmp" puts
/tmp on the internal floppy disk.

Document Title Hi!
Document URL http //68 68 97 224
Why, hello there!
This is my default site
by the numbers
I can only guess that you came here either because you are wondering what my default page looks like at the default level, or you have some amazingly old browser I mean hell I know there are NT 4 0 people out there and man that s got to suck as you can t browse anywhere or much of anything and Windows 95 users well they don t even have a default browser
So I ll go ahead here and do you a big favor and provide some *MUST* have stuff for all you people on insanely old browsers and whatnot to get you into something that can do at least HTTP 1 1
Service pack 6a for Windows NT 4 0 35M You may as well if you are on NT 4 0
Internet Explorer 3 0 5 4M A billion times better then IE 2 0 on NT!
Internet Explorer 4 01sp2 53M it has that cool desktop for NT 4 0/95
Internet Explorer 5 01sp2 80M I have no idea why you d want it
Internet Explorer 5 50sp2 85M the last IE for 95

File Edit Search View Respond
In the TOS episode "Metamorphosis" a classification for a planetary
body's atmosphere as it relates to habitability and/or suitability
for humanoid life is introduced. There it is mentioned that
approximately 34% of the bodies in the Gamma Canaris asteroid belt had
atmospherian types "H" to "M". (This would appear to be the Earthman
breathable range of the spectrum of atmospheric types.
It is very likely that this classification scheme is not based on the
English alphabet but instead on the initial letters of the Vulcan
words that describe planet's atmospheres. For example, the Vulcan
word "Min'shara" (which apparently translates to something like
"suitable for humanoid life") has probably been shortened to the class
letter "M". They are always talking about class M planets in Star
Trek.
Other clues that the classification is not based on the English
alphabet include

reproduced in the Appendix.
You can't move about the dungeon without a source of light. If you
attempt to do so, you will fall into the slavering fangs of a lurking
grue (grue = GReat Underground Empire) and get killed - somethir
is to be avoided as a matter of common sense. The game provide
with an obvious source of light at the beginning (the brass lamp), ar
there are two sections of the game where it is absolutely necessary
use the brass lamp as a source of light. Yet, if you attempt to use th
lamp for the entirety of the game, it will run out of power before you
can finish. Thus, you must make sure that you immediately seek ou
ivory torch which is to be found in the dungeon and, once you have
torch, you should extinguish the lamp to save it for later use. Continu
to carry the lamp with you because a thief who roams the dungeon
come along at any time and steal the ivory torch. You should recov
the torch if the thief steals it, or else use the save feature of the
game to get yourself back to a position where you still have the torc

COMDEX®

See the largest concentration of network computing products and services at the all-new Network Computing Showcase at COMDEX/Fall '91

Network Computing has brought a new era of computing solutions into the world marketplace and no other single forum will take you to the cutting edge of network computing like COMDEX. Starting with COMDEX/Fall '91 and continuing at COMDEX/Spring '92 in Chicago and at COMDEX/Fall '92 in Las Vegas the all-new Network Computing Showcase will be *the* place to gain strategic advantages in the exploding realm of network product development and distribution.

Look to COMDEX to put you in touch with America's largest concentration of companies producing the latest high-performance network computing products and client-server architecture—and show you how to make this technology a part of *your* business enterprise.

The first stop for network computing professionals will be the COMDEX/Fall '91 Network Computing Showcase, supported by Novell Inc. A dedicated exhibit at The Mirage will be complemented by a special Network Computing Conference. Supported by Novell Inc. and sponsored by *Network World*, the conference is a series of expert-driven sessions designed to arm you with the latest management insights, trends and technology developments.

For more information fax 617-449-2674 or telex 174273.

...every year...Connect at COMDEX

One solution to three of your biggest needs:

The new IBM PS/2 Model 30 286.

Power

Turn your cursor, for instance, into a high-resolution graphics image in a fraction of a second. Because the IBM Micro Channel Architecture™ Model 30 286 uses a fast 10 MHz 80286 machine, the same system that lets you run spreadsheets and word processing programs at high speed. Or, if you prefer, you can purchase the PS/2 Model 30, which has the processor to leverage up and 20 MHz chip.

What's more, as your business grows, you can add more memory and more processing power by adding up to 640K of memory right on the system board.

It's a big, powerful computer without a high price tag.

Affordability

The new Model 30 286 comes with many standard features that you'd normally have to purchase separately on other computers in its class. For example, the Model 30 286 gives you, as well as powerful processing capabilities, a full complement of ports for the attachment of peripherals. Like five slots open. So you can put the power to work for you by adding "software-triggered" cards for all your applications.

And, to help protect your PS/2's valuable asset information, it includes a built-in diskette security feature for system.

And, since these systems handle many routines in the software and have been designed to be very powerful, you'll be getting the most bang for your IBM dollar.

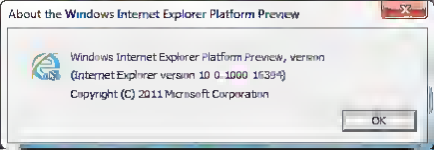

Compatibility

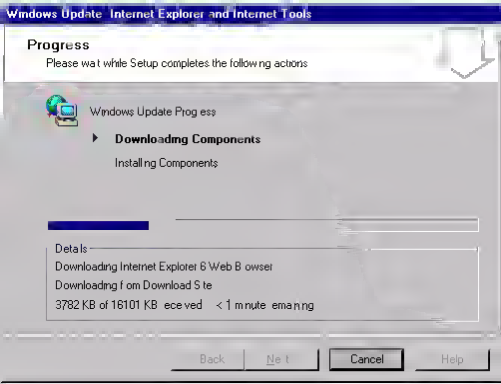

The Model 30 286 can run almost all of the software programs that are available for the IBM PC family. Today. Tomorrow. Developers' software is growing every day. All 3270 emulation and communications software packages, including those from IBM, will run on PS/2 models 30, 50, 60 and 80.

Yet the Model 30 286 has more to offer with the first of the PS/2 family. It can communicate with the third generation of personal computers from IBM, as well as with its own IBM PS/2™ systems. And

For more free details about the Model 30 286 or any of the other IBM Personal System/2 models, contact your IBM Authorized Dealer or IBM Marketing Representative. Or call 1-800-IBM-2468. And, for IBM, the 286 that's the new Model 30 286 is an open system that's right for today, ready for tomorrow.

IBM

Microsoft LAN Manager Setup - Installation
Microsoft LAN Manager Setup
Setup configures your computer for use with LAN Manager,
Windows NT, and Windows for Workgroups networks. Before you
begin LAN Manager installation, determine the following
* The network adapter installed in the computer
* The settings used on that adapter (for example, the
interrupt and the memory address)
* The name of the network protocol(s) to be used on
the computer (for example, NetBEUI)
For more information see the installation guide for your
client software

NT looks real at Comdex

Microsoft declares it will start beta tests in early 1992

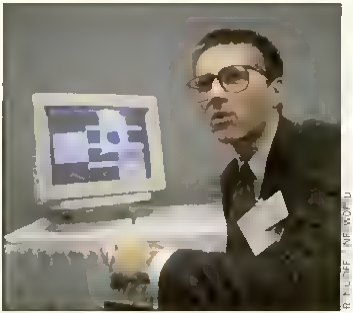

BY STUART J. JOHNSTON

LAS VEGAS — Microsoft Corp made one thing clear last week at Comdex: It intends to meet its aggressive delivery schedule for Windows NT.

The Redmond, Washington, company widely demonstrated Windows NT (New Technology) — its high-end, portable, 32-bit, multitasking operating system with a Windows 3.1 user interface — showing several versions of Windows NT running on Intel X86 PCs (including a souped-up 75-MHz machine) and MIPS R4000 workstations.

Microsoft is also shipping 200 to 300 copies of the MS Windows 32-bit Development Kits, which include Windows NT, to selected independent software vendors. Those ISVs will receive the developer kits free. A full-blown beta program is scheduled to begin in the first quarter of 1992.

One impressive demo featured a symmetrical multiprocessing version of Windows NT hosted on a four-processor, 80486-based system, set to ship from AT&T subsidiary NCR in the first quarter. The NCR System 3000 Model 3450, which can run at nearly 160 MIPS, will initially ship with a special version of Unix System V, Release 4, according to NCR.

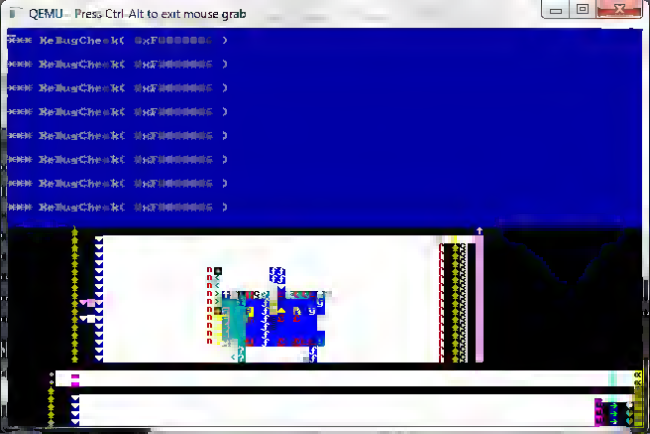

Windows NT's product manager, Carl Stork, says Microsoft will ship the multiprocessing version at the same time it ships the commercial release.

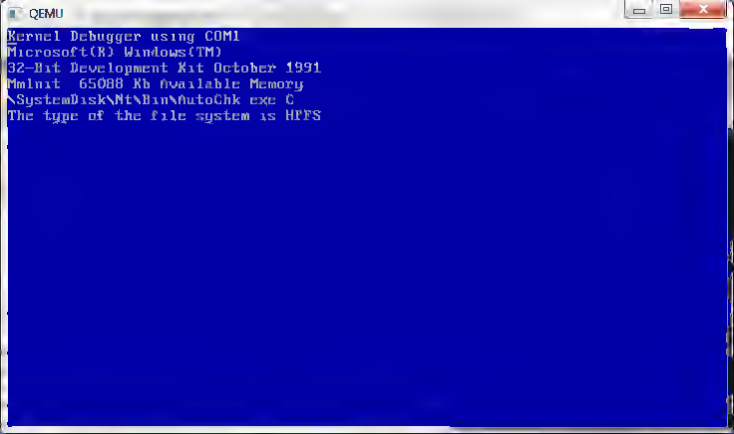

Carl Stork, product manager for Windows NT, said Microsoft plans to ship the multiprocessing version at the same time it ships the commercial release in the second half of 1992. The end-user version will require 8 megabytes of RAM, which also includes space for applications and files, Stork said.

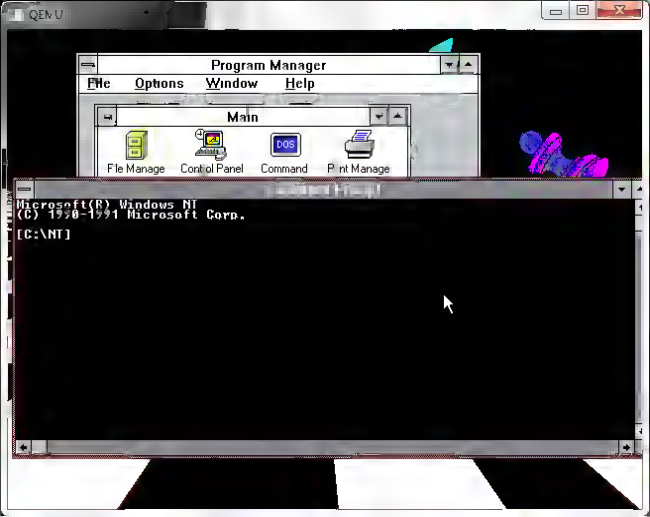

The 32-bit Windows developer's kit will be available on CD ROM, and the commercial release will also be available on floppy disks. Initial applications developed with the kit will run on Windows NT; they will also run on a 32-bit version of Windows for DOS scheduled to ship in 1993, Stork said.

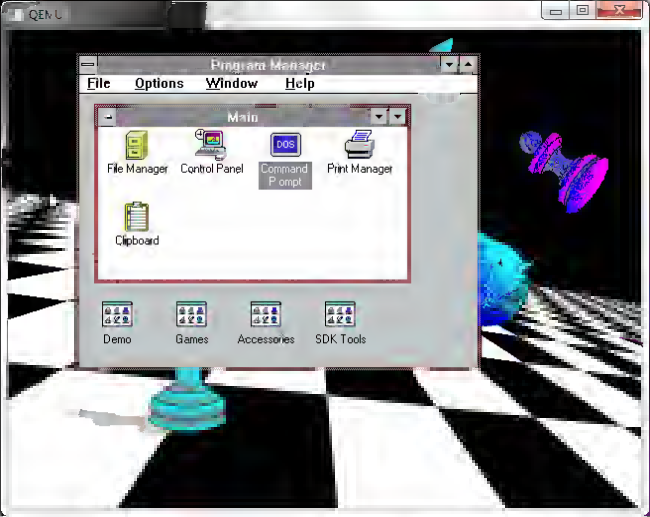

Steve Ballmer, senior systems vice president, demonstrated a 32-bit version of Excel for Windows and other applications running on Windows NT. Ballmer said Corel Systems Corp. has estimated it would take about a month to convert its 16-bit CorelDraw to 32 bits. Novell has been working on a 32-bit NetWare requester for Windows NT for months. Windows 3.1, now set to ship by March or April, will add the audio portions of the Multimedia Extensions for Windows to the standard 3.1 release, he added.

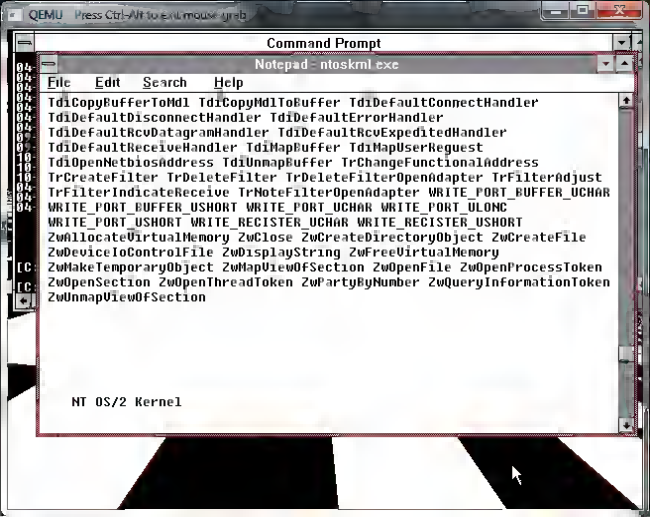

"We have one more beta planned [for] the next several weeks," Ballmer said. "All features are in, and so is the performance, [so we're] just fixing bugs."

Remove the diskette from drive A
Insert the Operating System/2 Diskette 1 into drive A
Then, press Enter

Welcome to OS/2

The following screens guide you through installing the Operating System/2 (tm) program on a hard disk

In addition to the Operating System/2 Installation Diskette, you must have Operating System/2 Diskettes 1 through 15 to complete the installation.

Press Enter to begin the installation. Refer to the Installation Guide for assistance if you are installing multiple operating systems.

Press Enter to continue or Esc to cancel

Enter Esc=Cancel

Preparing the Hard Disk

Preparing the hard disk is a two-step process. The first step, partitioning, defines one or more partitions on the hard disk. The second step prepares the partitions to accept data.

If you select option 1, one partition (which takes up the entire hard disk) will be created. If you want more than one partition on the hard disk, select option 2. If you need assistance, refer to the Installation Guide for examples of partitioning the hard disk.

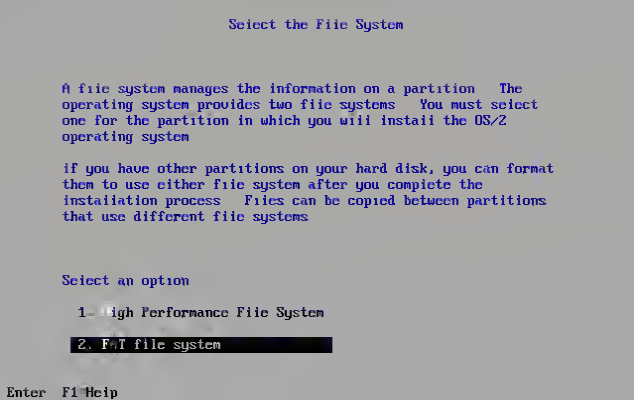

Select an option:

1. Accept predefined installation partition

2. Specify your own installation partition

If you select option 2, the FDISK screen is displayed.

Enter Esc Cancel F1 Help

Select the File System
A file system manages the information on a partition The operating system provides two file systems You must select one for the partition in which you will install the OS/2 operating system
if you have other partitions on your hard disk, you can format them to use either file system after you complete the installation process Files can be copied between partitions that use different file systems
Select an option
1. High Performance File System
2. FAT file system

Defining Disk Partitions
Define the partitions required for the ESX Server System. The partitioning screen lists only the drive and the amount of available space. Whether you automatically or manually create partitions, the ESX Server system requires a minimum of three partitions as described below. You can use the free space to divide a fourth partition into a number of logical partitions.
Note: If you do not know how to partition your system, please read the section on partitioning in the VMware ESX Server Installation Guide.
The graphical representation of your hard drive(s) allows you to see how much space has been dedicated to the various partitions

MICROSOFT STRIKES GOLD.

This is what paydirt looks like when it's turned into silicon.

Intel's iAPX 80286 microprocessor.

Together, Microsoft and Intel used this gem to create another the XENIX® 286 Operating System. The most powerful implementation of UNIX® on the market today for any microprocessor. And the most reliable, functional, commercial enhancement of the UNIX operating system ever created.

The XENIX 286 Operating System includes UNIX enhancements available from both AT&T™ and U.C. Berkeley. But Microsoft has also added loads of other commercial enhancements to make your life richer, in more ways than one. For instance, there are record and file locks, semaphores to help manage multiuser/multitasking data, and automatic disk recovery for better reliability.

Which makes XENIX 286 an ideal Operating System for applications software development. Over one hundred and fifty customized business software packages have been developed for XENIX, making it one of the most useable multiuser Operating Systems available today.

For Microsoft, the unique advantages of Intel's 80286 microprocessor were most appealing. As Bill Gates, chairman of Microsoft, said, "On chip memory management and protection offered by the 286 ensures code compatability and makes it easy to port XENIX between different OEM systems."

In addition, its ability to run in fast 8086 mode makes the 286 the only processor that can support both XENIX 286 and MS-DOS without additional hardware. "With this ability, users get the best of both worlds in one piece of hardware," said Gates.

What's more, it's the only microprocessor architecture with the flexibility to offer you entry at whatever level of integration you choose: chips, boards or complete systems (including, of course, our new 286/310 supermicro system.) So you get to market when you want in the way you want.

Bill Gates, Chairman of Microsoft Corp.

Why not dig a little deeper, and call us toll free at (800) 538-1876 in California, (800) 672-1833. Or write Intel Lit. Dept. #S9, 3065 Bowers Avenue, Santa Clara CA 95051.

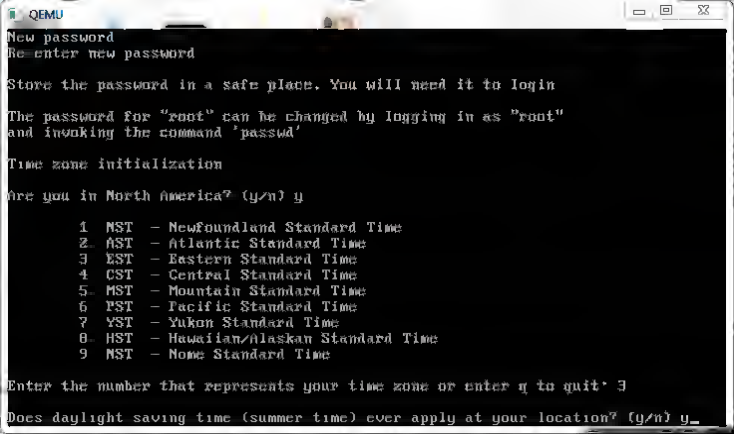

And don't be surprised if you hear shouts of "Eureka!" coming from your product development team.

Welcome to Microsoft Operating System/2
The Install program will guide you through the steps
required to prepare your computer for MS OS/2 and to install
MS OS/2 on your hard disk.
There are three parts to the installation procedure:
* Preparing your hard disk.
* Selecting your configuration options.
* Creating directories and copying files from the MS OS/2
disks.
To install MS OS/2, you will need your MS OS/2 Program and
Supplemental disks and the Microsoft Operating System/2
Setup Guide.
Press ENTER to continue.
F1=Help
Press ENTER to Continue
ESC=Exit

Your computer has the following hardware:
635 kilobytes (K) of Random Access Memory (low)
7168 K of random-access memory (extended)
32648 K available disk space
1 Serial ports
0 Parallel ports
1 Floppy-disk drive(s)
1 Hard disk(s)
VGA graphics adapter
Math co-processor present
Press ENTER to continue.
F1=Help
Press ENTER to Continue
ESC=Exit

Installation Options
Select one of the following installation options. Type the number of your selection.
1. You are installing MS OS/2 on a new computer.
2. You are installing MS OS/2 on a computer that already has DOS 3.x installed, and you want to replace DOS 3.x with MS OS/2.
3. You are installing MS OS/2 on a computer that already has an earlier version of MS OS/2 installed, and you want to update MS OS/2.
4. You are installing MS OS/2 on a computer that already has DOS 3.x installed, and you want to have both DOS 3.x and MS OS/2 installed on the hard disk.
Type your selection: [4]
Press ENTER to continue.
F1=Help
Press ENTER to Continue
ESC=Exit

Selecting a Mouse
Select the mouse you will be using with MS OS/2. Type the letter of your selection.
Mouse:
A. Microsoft bus mouse (version 5.02 or below)
B. Microsoft bus mouse (version 5.03 or greater, inport)
C. Microsoft serial mouse attached to COM1
D. Microsoft serial mouse attached to COM2
E. Visi-On Mouse
F. PC Mouse by Mouse Systems
G. Other, none
Type your selection: [G]
Press ENTER to confirm your selection.
F1=Help
Press ENTER to Continue
ESC=Exit

Selecting a Printer and Printer Port
Select the printer you will be using with MS OS/2 and the port the printer will be connected to. Type the number and port name you select.
Printer:
Port:
1. IBM 4201
2. IBM 5202
3. Other, none
COM1
COM2
LPT1
LPT2
Type your selection. Use the DIRECTION keys (↑,↓) to move the cursor.
Printer selection: [1]
Printer connected to: [lpt1]
Press ENTER to confirm your selection.
F1=Help
Press ENTER to Continue
ESC=Exit

Continuing with Install
To continue installing MS OS/2, do the following:
- Remove the Install disk from the drive.
- Press CONTROL+ALT+DELETE to restart your computer
If you are installing MS OS/2 in addition to DOS 3.x, you will be prompted to use OS/2 or DOS 3.X. Select OS/2 by pressing ENTER.

Installing Program and Supplemental Disks
To continue installing MS OS/2, you must copy files from the
Program and Supplemental disks to your hard disk.
Place the Program disk in drive A and close the drive
door.
Press ENTER to continue.
F1=Help
Press ENTER to Continue
ESC=Exit

Copy Program and Supplementary Disk

Install is now copying files to your hard disk.

file #: 19

copying file: a:\CRE\TEDD.EXE

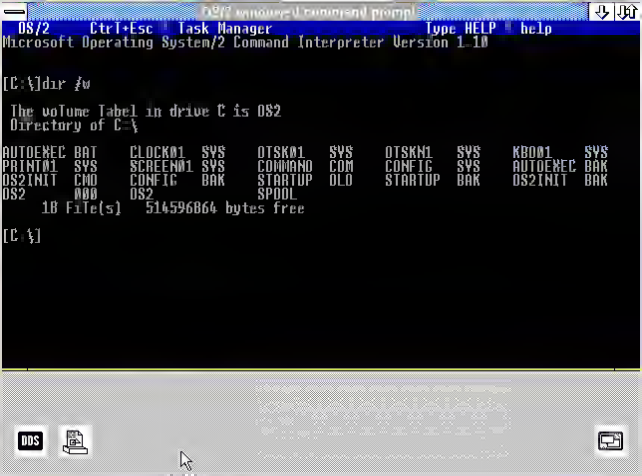

All files have been copied from the Program diskette.
Remove the PROGRAM diskette from drive A: and insert
the Supplemental diskette.

Press ENTER to continue:

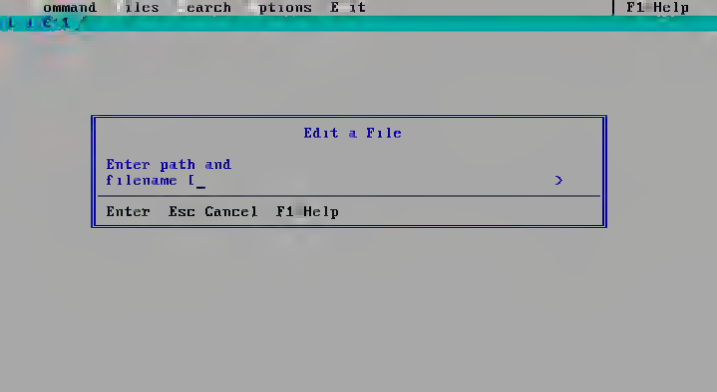

F1=Help Press ENTER to Continue ESC=Exit

Installation Completed
MS OS/2 is now installed on your hard disk.
To begin using MS OS/2:
- Remove the Supplement disk from the drive.
- Press CONTROL+ALT+DELETE to restart your computer.
If you are installing MS OS/2 in addition to DOS 3.X, you will be prompted to use OS/2 or DOS 3.X. Select OS/2 by pressing ENTER.

Welcome

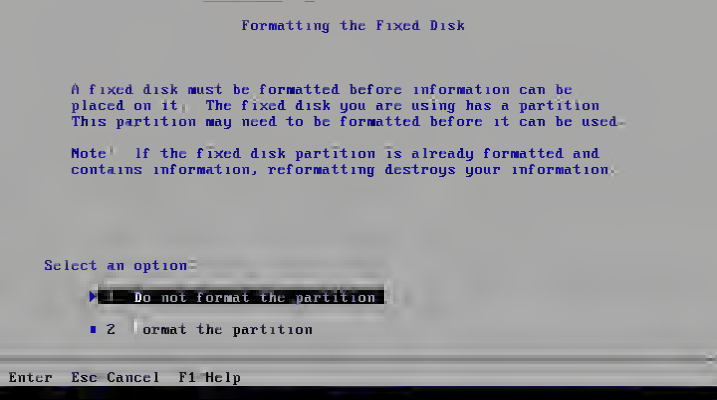

Welcome to Microsoft Operating System/2. The following screens will guide you through installing Microsoft Operating System/2 on a fixed disk.

In addition to the Microsoft Operating System/2 installation diskette, you should have Microsoft Operating System/2 diskettes 1 through 4 before starting.

During this installation, if you use a keyboard other than U.S. English, refer to the U.S. English keyboard template in the MS OS/2 Desktop Reference, Appendix 'Code Pages and Keyboard Layouts'.

Press Enter (<-┘) to continue or Esc to cancel.

Enter Esc Cancel

Formatting the Fixed Disk
A fixed disk must be formatted before information can be placed on it. The fixed disk you are using has a partition. This partition may need to be formatted before it can be used.
Note: If the fixed disk partition is already formatted and contains information, reformatting destroys your information.
Select an option:
1 Do not format the partition
2 Format the partition
Enter Esc Cancel F1 Help

The fixed disk preparation is complete.

REMOVE "Microsoft Operating System/2 Installation Diskette" from drive A.

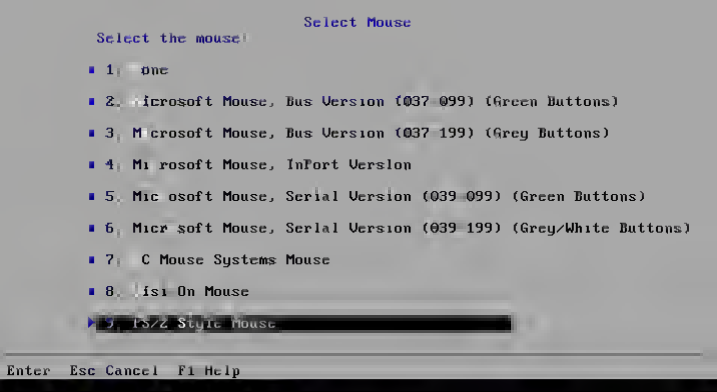

To continue, press and hold the Ctrl and Alt keys, then press
the Del key.

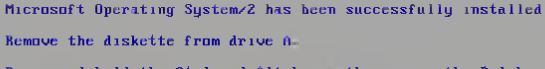

Installing Microsoft Operating System/2

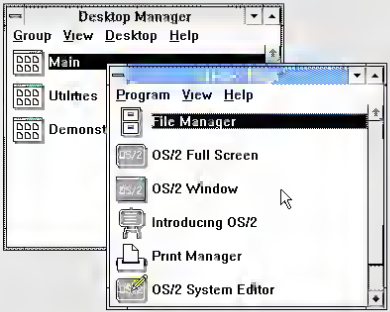

INSERT "Microsoft Operating System/2 Diskette 1" into drive A:

Press Enter to continue

Enter F3 Exit

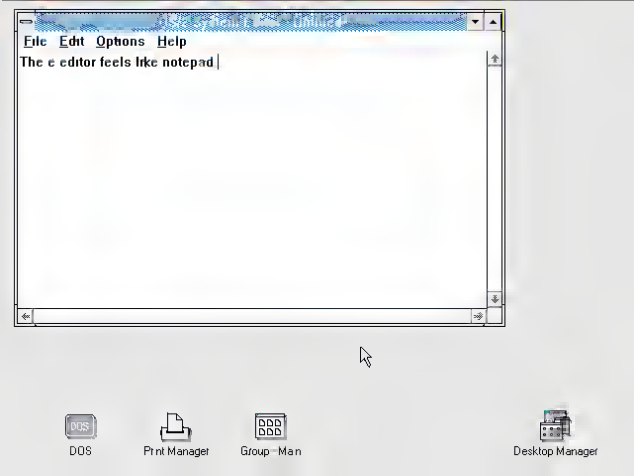

Select Mouse
Select the mouse
1. None
2. Microsoft Mouse, Bus Version (037.099) (Green Buttons)
3. Microsoft Mouse, Bus Version (037.199) (Grey Buttons)
4. Microsoft Mouse, InPort Version
5. Microsoft Mouse, Serial Version (039.099) (Green Buttons)
6. Microsoft Mouse, Serial Version (039.199) (Grey/White Buttons)
7. Mouse Systems Mouse
8. Visi On Mouse
9. PS/2 Style Mouse
Enter Esc Cancel F1 Help

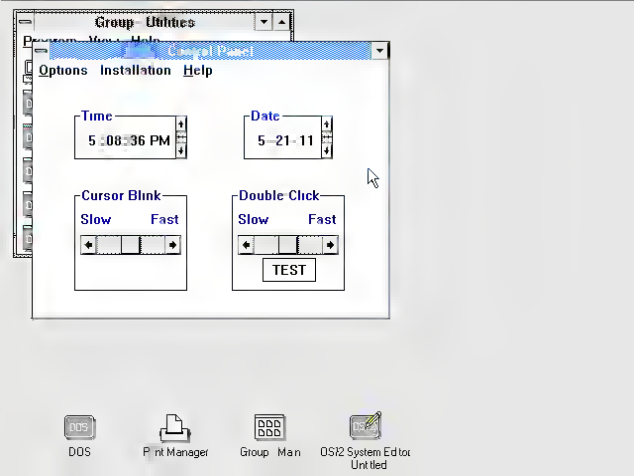

Microsoft Operating System/2 has been successfully installed
Remove the diskette from drive A
Press and hold the Ctrl and Alt keys, then press the Del key
to start Microsoft Operating System/2.

Enter to continue or Esc to cancel

Welcome
Welcome to Operating System/2. The following screens will guide you through installing Operating System/2 on a fixed disk
In addition to the Operating System/2 Installation Diskette, you should have Operating System/2 Diskettes 1 through 5 before starting.
During OS/2 Installation you can install the Dual Boot feature that allows you to start either OS/2 or DOS from the same fixed disk. This feature requires DOS version 3.2, 3.3 or 4.0 to be installed on your fixed disk (drive C) before installing OS/2. However DOS 3.3 or 4.0 is recommended for compatibility with OS/2. This feature can also be installed if you have a previous OS/2 version that uses Dual Boot. Refer to the Getting Started book for information on using DOS and OS/2 on the same system.
Enter to continue or Esc to cancel
Enter Esc Cancel

Installing Operating System/2

Remove the diskette from drive A

Insert the Operating System/2 Diskette 1
into drive A. Then, press Enter

Enter

Formatting the Primary Partition

The primary partition on a fixed disk must be formatted before information can be placed on it. If the primary partition has been formatted by DOS or OS/2, it is not necessary to format it again.

The primary partition can be formatted to use either the High Performance File System (HPFS) or the File Allocation Table (FAT) file system. In order to switch file systems, you must reformat the partition.

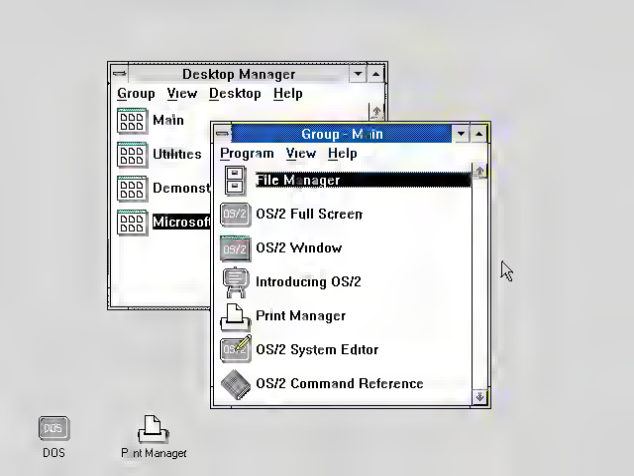

Note: Reformatting erases both program and data files. If you need these files, refer to "Options Before Installing" in the Getting Started book.

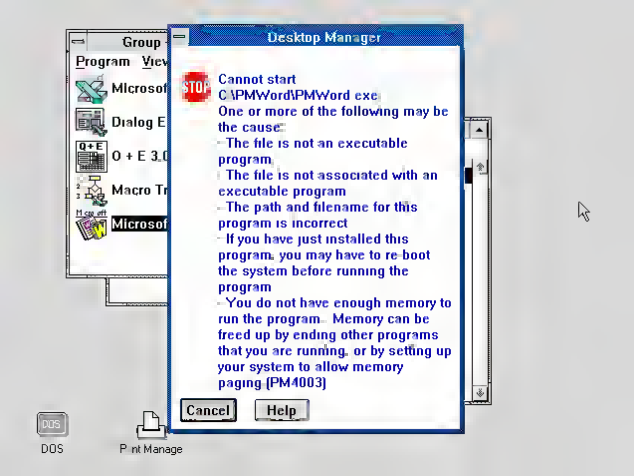

Select an option.

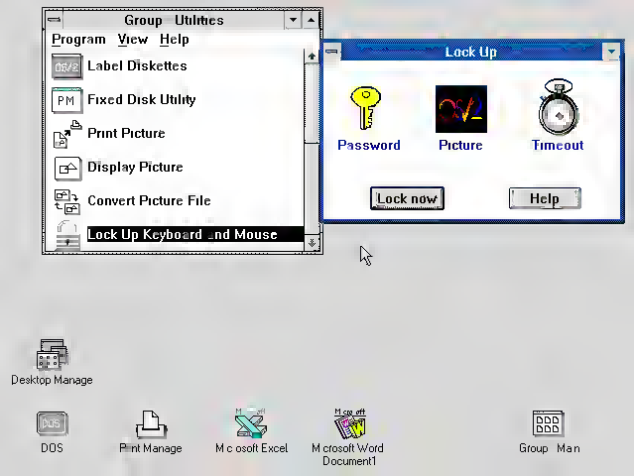

1. Do not format the partition

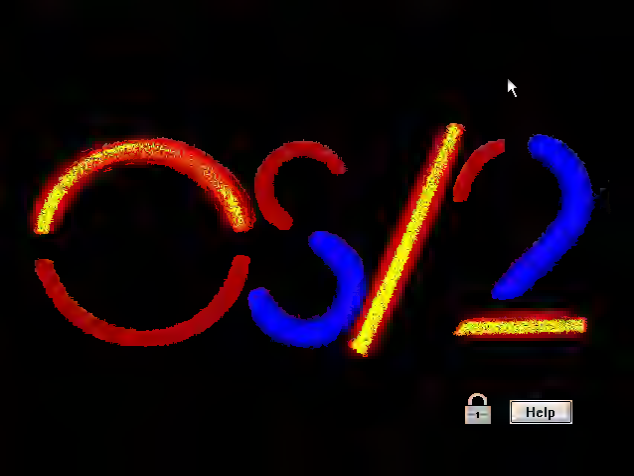

2. Format the partition

Introduction

During OS/2 installation, you make choices by selecting an item from a list. Once a choice is made, you can proceed to the next step. At times you may want to review information or request further help.

- To make a choice, use the up and down arrow keys to indicate the item you want.
- To proceed to the next step, press Enter.
- To return to the previous screen, press Esc.
- To see help information, press F1.

Esc and F1 can be used when shown at the bottom of the screen.

Formatting the Primary Partition
The primary partition on a fixed disk must be formatted before information can be placed on it. If the primary partition has been formatted by DOS or OS/2, it is not necessary to format it again.
The primary partition can be formatted to use either the High Performance File System (HPFS) or the FAT file system. If you have other partitions on your fixed disk, you can format them to use either file system after you have installed OS/2. Files may be copied between partitions that use different file systems.
Note: Reformatting erases both program and data files. If you need these files, or if you want to repartition your fixed disk, refer to the Getting Started book before continuing installation.
Select an option.
1 Do not format the partition
2 ormat the partition
F1 Help

Select Installation Options

During installation, you can either accept the predefined system configuration or define your system configuration.

Select an option.

1 Accept the predefined system configuration

2 Select system configuration

IBM Operating System/2 Installation
Version 2.00

(C) Copyright IBM Corp. 1981, 1991, 1992. All rights reserved.

Remove the diskette from drive A.

Insert the Operating System/2 Diskette 1 into drive A.
Then, press Enter.

Welcome to OS/2

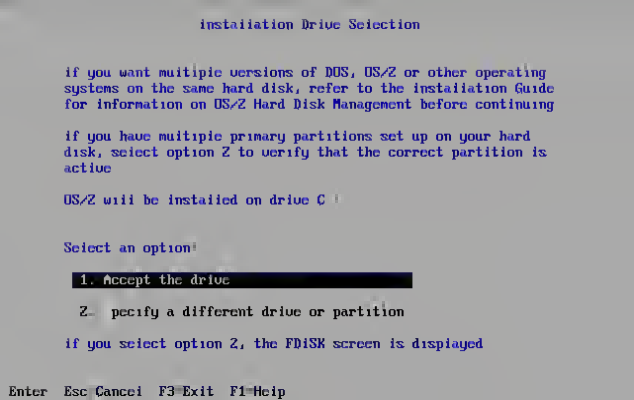

The following screens guide you through installing the Operating System/2 (tm) program on a hard disk

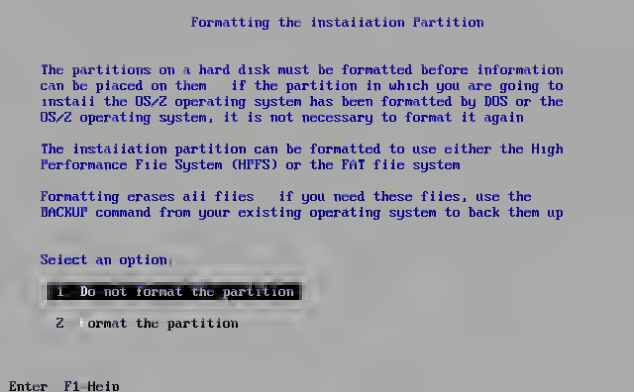

In addition to the Operating System/2 Installation Diskette, you must have Operating System/2 Diskettes 1 through 15 to complete the installation.

Press Enter to begin the installation. Refer to the Installation Guide for assistance if you are installing multiple operating systems.

Press Enter to continue or Esc to cancel

Enter=OK Esc=Cancel

Installation Drive Selection
If you want multiple versions of DOS, OS/2 or other operating systems on the same hard disk, refer to the Installation Guide for information on OS/2 Hard Disk Management before continuing
If you have multiple primary partitions set up on your hard disk, select option 2 to verify that the correct partition is active
OS/2 will be installed on drive C:
Select an option:
1. Accept the drive
2. Specify a different drive or partition
If you select option 2, the FDISK screen is displayed
Enter=OK Esc=Cancel F3=Exit F1=Help

Formatting the Installation Partition
The partitions on a hard disk must be formatted before information can be placed on them. If the partition in which you are going to install the OS/2 operating system has been formatted by DOS or the OS/2 operating system, it is not necessary to format it again.
The installation partition can be formatted to use either the High Performance File System (HPFS) or the FAT file system.
Formatting erases all files. If you need these files, use the BACKUP command from your existing operating system to back them up.
Select an option.
1 Do not format the partition
2 Format the partition
Enter F1=Help

OS/2 Setup and Installation
OS/2 Setup and Installation is complete
Remove the diskette from drive A.
You will need to shutdown and restart
the system in order for changes to
take effect. Select OK to shutdown now.
Installation Note
To ensure a successful install, we may have
installed certain defaults. Some systems may
default to VGA and no audio. To change this,
shutdown and restart, then use Selective
Install in the System Setup folder. See the
User's Guide to OS/2 for details

Installing Operating System/2

Welcome to OS/2!

To begin the installation, select one of the following methods.
Then press Enter.

1 Easy Installation

Easy Installation is intended for most users of OS/2. The system makes decisions for you based on your current computer setup. Press F1 now for more information.

2 Advanced Installation

Advanced Installation is intended for experienced technical users. You must make decisions about your computer setup. Press F1 now for more information.

Enter F3=Command Prompt F1=Help

Invalid Base Product Level Incorrect Version

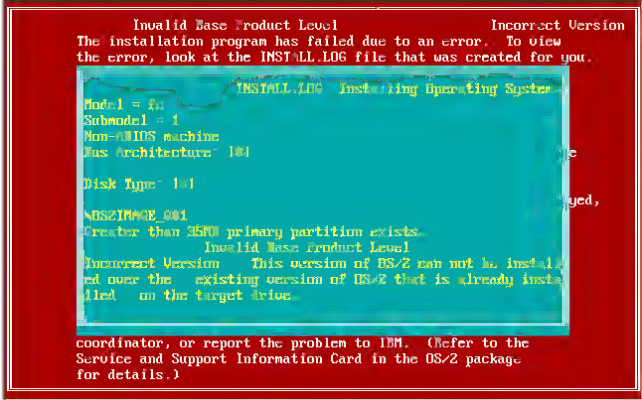

The installation program has failed due to an error. To view the error, look at the INSTALL.LOG file that was created for you. That file gives the condition that caused the error.

Press Enter to display INSTALL.LOG

To take action to correct the error, insert the Operating System/2 Installation Diskette in drive A. Press and hold the Ctrl and Alt keys, then press the Del key. When the Logo panel is displayed, remove the Installation diskette, insert OS/2 Diskette 1 and press Enter. When the Welcome screen is displayed, press Esc.

Once you have corrected the error, restart OS/2 Installation by inserting the Operating System/2 Installation Diskette in Drive A. Press and hold the Ctrl and Alt keys, then press the Del key.

If the problem persists, contact your dealer or technical coordinator, or report the problem to IBM. (Refer to the Service and Support Information Card in the OS/2 package for details.)

Invalid Base Product Level

coordinator, or report the problem to IBM. (Refer to the
Service and Support Information Card in the OS/2 package
for details.)

Formatting the Installation Partition

The partitions on a hard disk must be formatted before information can be placed on them. If the partition in which you are going to install the OS/2 operating system has been formatted by DOS or the OS/2 operating system, it is not necessary to format it again.

The installation partition can be formatted to use either the High Performance File System (HPFS) or the FAT file system.

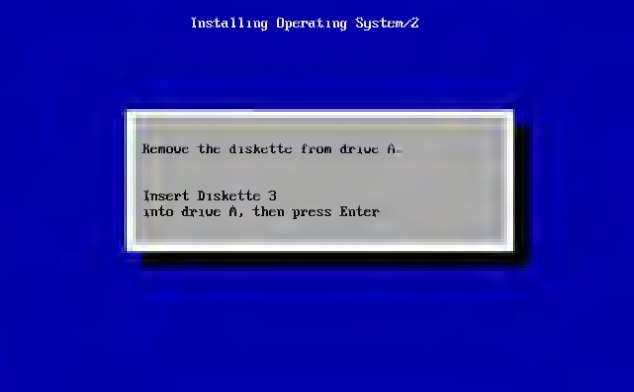

Formatting erases all files. If you need these files, use the BACKUP command from your existing operating system to back them up.

Select an option.

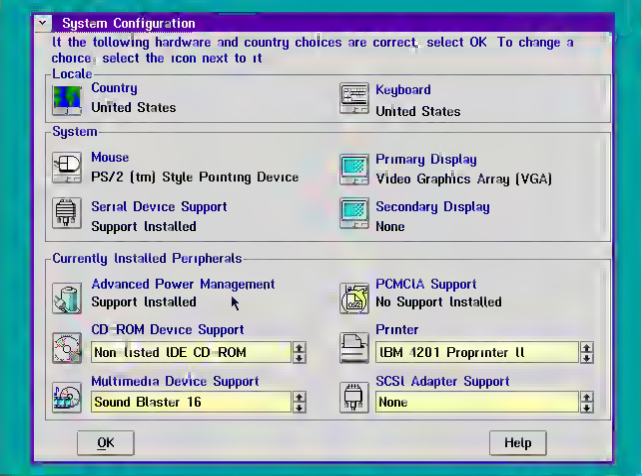

1. [illegible]

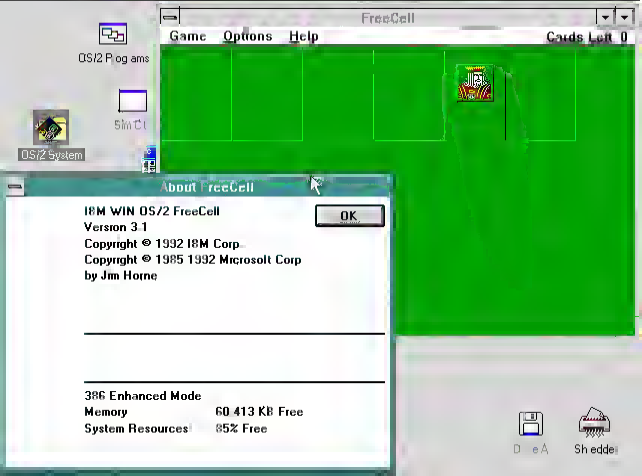

2. Format the partition

Remove the diskette from drive A

Insert the OS/2 Diskette 1 into drive A
Then, press Enter

IBM
OS/2
WARP

Welcome!

Congratulations on your purchase of IBM OS/2 Warp.
OS/2 Warp contains OS/2 Warp version 4*, BonusPak, VoiceType Dictation
for OS/2 (Personal Edition), Java for OS/2, and the following powerful
networking services:

- File and Print Sharing Services
- Remote Access Client
- System Management Client
- Password Coordination
- TCP/IP Services
- Mobile Office Services

The following panels will guide you through the installation of
OS/2 Warp operating system and the networking services that you select.

* "OS/2 Warp" or "Operating System/2 version 4" or "Operating System/2"
references throughout these programs refer to the OS/2 Warp version 4
Operating System product, which is included in OS/2 Warp, plus
IBM and other networking products.

Enter=Continue F3=Command Prompt

Installing OS/2 Warp 4
Welcome to OS/2!
To begin the installation, select one of the following methods.
Then press Enter.
1. Easy Installation
Easy Installation is intended for most users of OS/2 Warp 4
The system makes decisions for you based on your current computer
setup. Press F1 now for more information.
2. Advanced Installation
Advanced Installation is intended for experienced technical
users. You must make decisions about your computer setup.
Press F1 now for more information.
Enter F3 Command Prompt F1 Help

Formatting the Installation Partition

The partitions on a hard disk must be formatted before information can be stored there. If the partition where you are going to install OS/2 Warp has been formatted by DOS or OS/2, it is not necessary to format it again.

The installation partition can be formatted to use either the High Performance File System (HPFS) or the File Allocation Table (FAT) file system. If you want to convert to a different file system, you must choose "Format the partition"

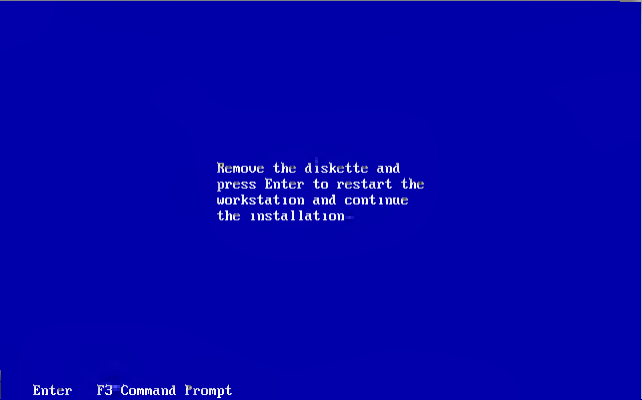

Formatting erases all files. If you need these files, use the BACKUP command from your existing operating system to back them up

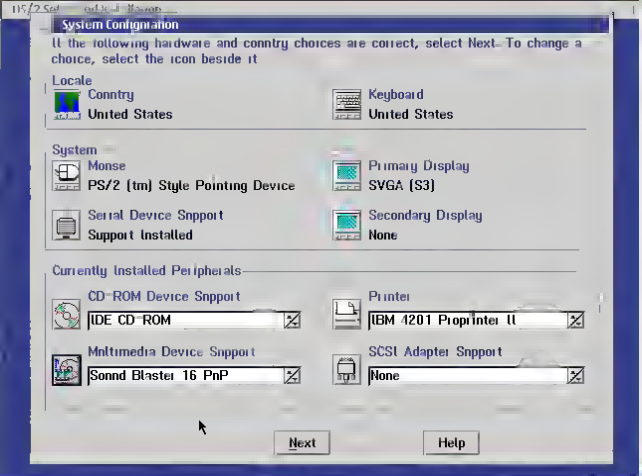

Select an option

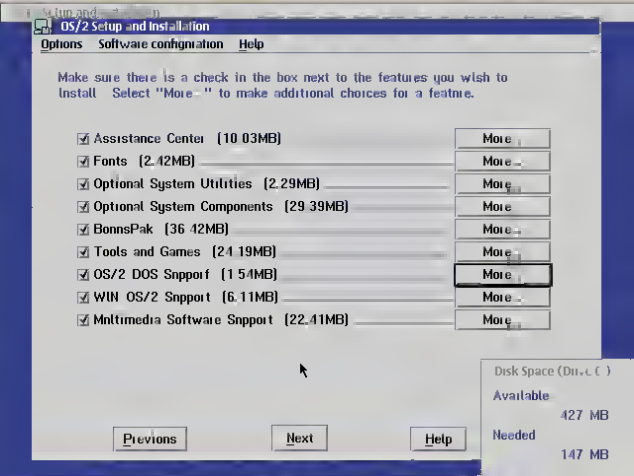

1. Do not format the partition

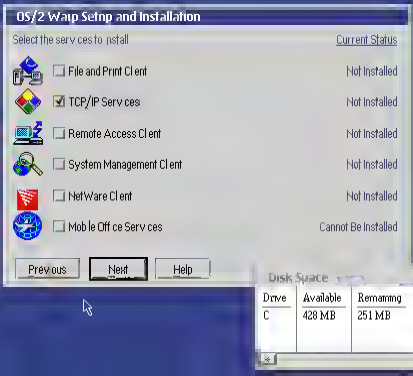

2. Format the partition

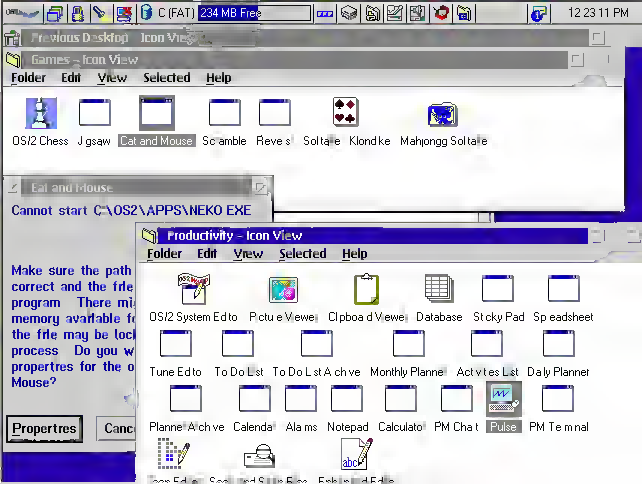

Enter F1 Help

Remove the diskette and
press Enter to restart the
workstation and continue
the installation
Enter F3=Command Prompt

RetroMUD

retromud.superglobalmegacorp.com

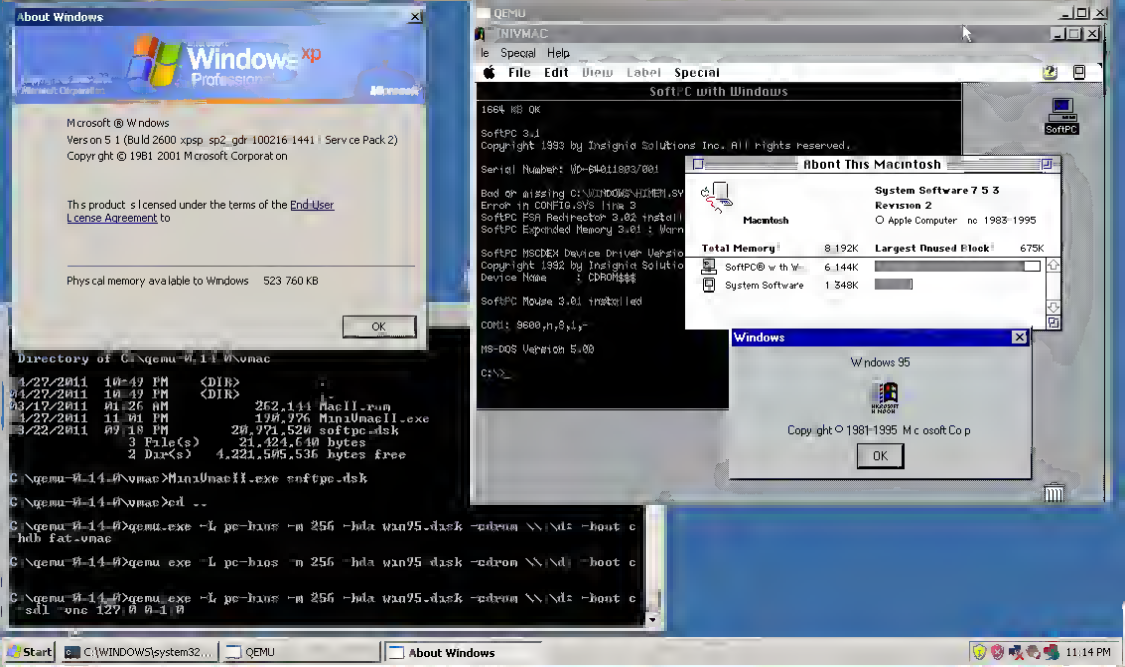

Other bookmarks

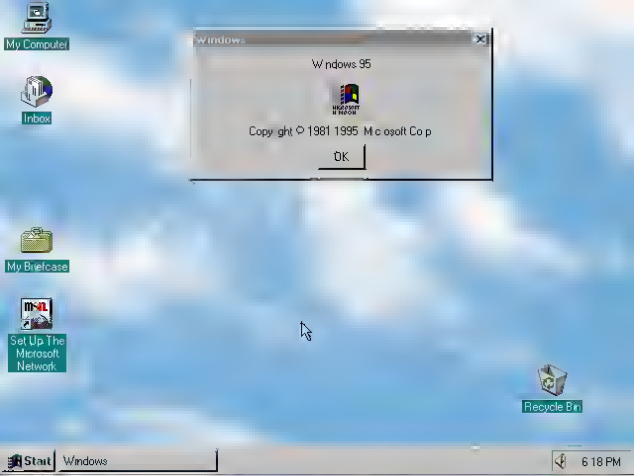

This is my simple page to describe the MUD running here. RetroMUD. Retromud is a build of abermud 2.0 on 4.3BSD, being hosted on a SIMH VAX 11/780

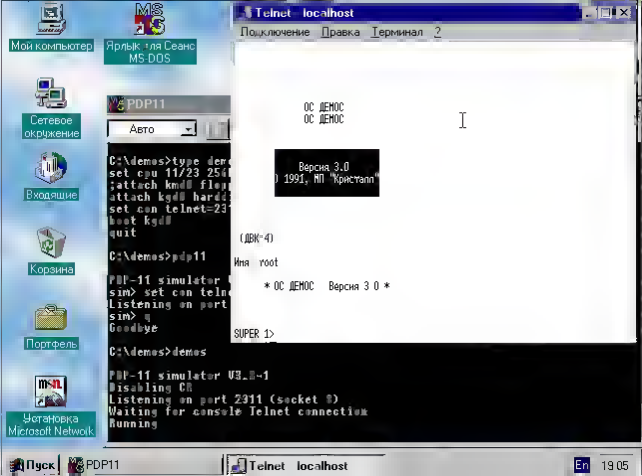

Access to the system is quite easy, simply telnet to retromud.superglobalmegacorp.com, and you'll get the login.
Or try the flash based telnet program below!

And you can basically take it away from there

You can select the number of network adapters you want to have on this virtual machine. You can then select which network adapter from the physical computer will be used for network communication with each virtual adapter. You can also select to use the local network or, for the first adapter, the shared network.

START

After everything you've heard about Windows Computing, there are only two things you should believe.

Windows™ Computing

Free Working Model

Microsoft®

Your eyes.

See for yourself. With Windows™ Computing, using your PC becomes easier, faster, and more productive than you ever imagined possible. But you don't have to take our word for it. Because, right now, we're making fully functional Working Models of Microsoft Windows version 3.0, Microsoft Excel, Project, Word and PowerPoint® presentation graphics program as easy to get a hold of as they are to use.

Windows Computing is the Windows version 3.0 environment combined with any of the hundreds of Windows applications already available.

Just pick up the phone and call (800) 323-3577, Dept. N63, and we'll send you a free copy of the Working Model™ you're most interested in.

Or, if you would prefer, just ask for the date, time and location of a Windows Computing seminar being held near you. Either way, the experience is sure to impress you.

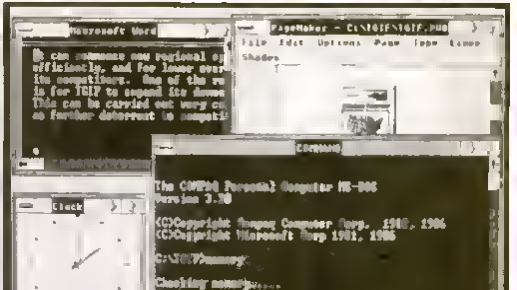

The truth is, we believe there could be only one reason why people might not see just how much Windows Computing means to the future of the personal computer.

They haven't looked.

Microsoft
Making it all make sense™

Offer good only in the 50 U.S. and D.C. ©1990 Microsoft Corporation. All rights reserved. Microsoft, PowerPoint and the Microsoft logo are registered trademarks and Making it all make sense and Windows are trademarks of Microsoft Corporation.

**The First Working Model you select is free during our Windows Computing Promotion, September 15 through December 31, 1990. One free Working Model per person. Each additional Working Model is $9.95, applicable sales tax not included. Offer good on*

Windows 386, which will be bundled on Compaq systems, runs multiple applications simultaneously in overlapping windows

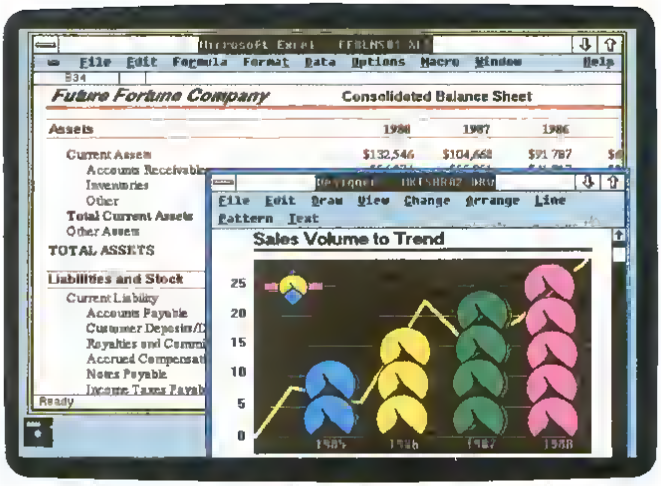

Microsoft Windows/386
Version 2.01

Copyright (c) Microsoft Corporation, 1987. All Rights Reserved.
Microsoft is a registered trademark of Microsoft Corp.

Look familiar?

Then this $50 upgrade will look great.

If this looks like your current version of Windows, you can upgrade for just $50.

You may have received Microsoft Windows with your hardware. If you did, you can save $99 with this upgrade offer.

Check out your software because if it works within a Windows environment, you're in luck.

If you are using Microsoft® Windows,™ the best thing about this offer, besides the special upgrade price, is that you'll now have access to all the memory in your PC. Not to mention that you can keep using your existing MS-DOS® applications, multitask with other Windows applications, and network more easily.

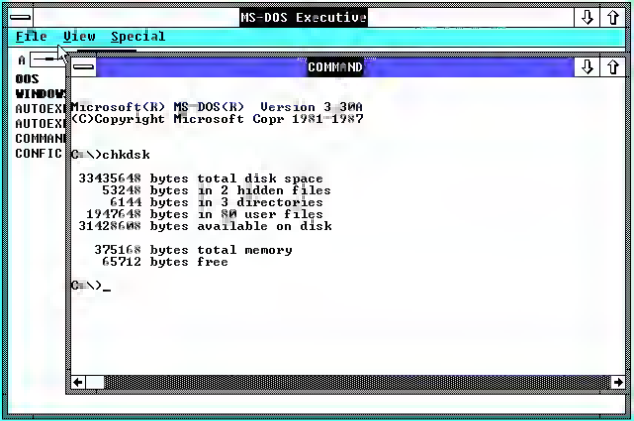

All the popular Windows applications have already been updated to utilize Windows 3.0's powerful capabilities. And most are offering low-cost or free updates. So if you have any version of Windows—including runtime Windows—give us a call. We'll upgrade your copy of Windows, help you update your applications, and answer any questions you may have.

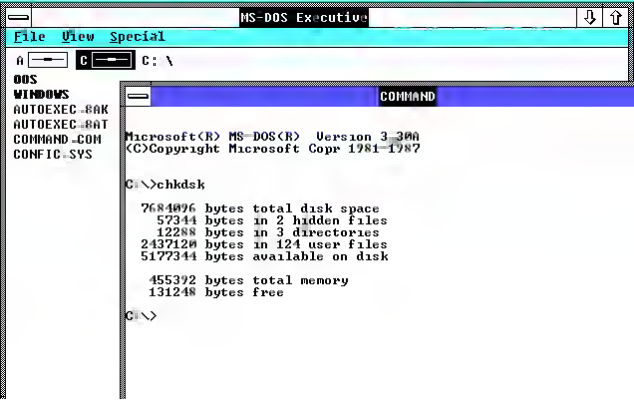

But make sure and call for your $50* Windows upgrade before September 15, 1990. You'll save $99 off the suggested retail price of $149. And you'll be using Windows 3.0. Which will make you look great.

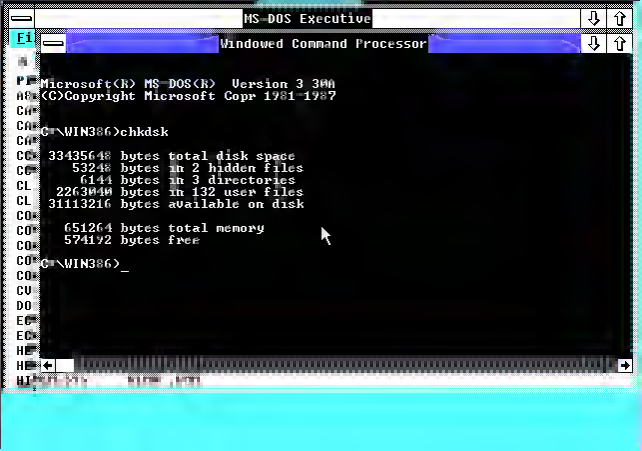

To get your Windows upgrade for just $50, call (800) 323-3577, Dept. L56.

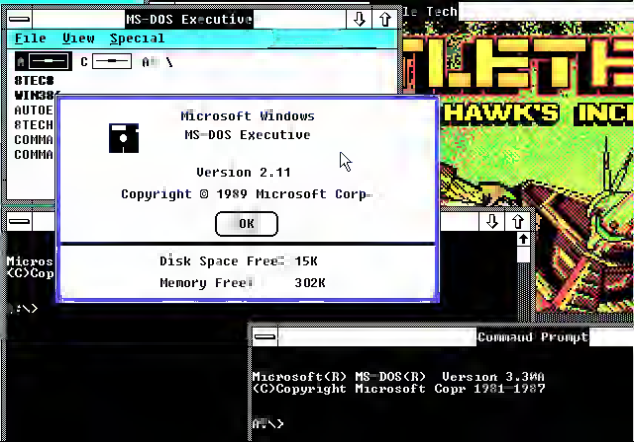

Microsoft
Making it all make sense®

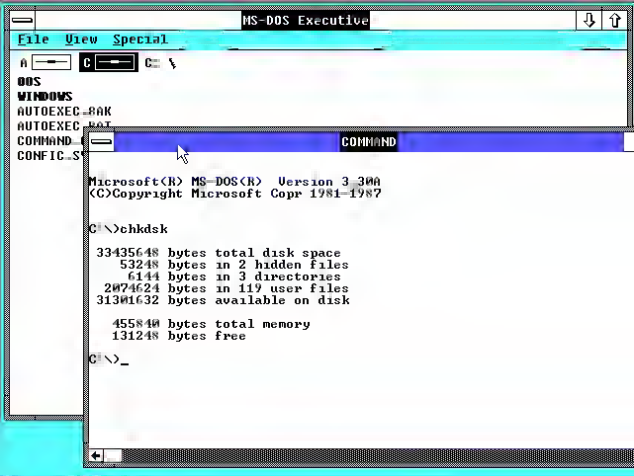

©1990 Microsoft Corporation. All rights reserved. Microsoft, the Microsoft logo and MS-DOS are registered trademarks and Making it all make sense and Windows are trademarks of Microsoft Corporation. *Offer good only in the 50 United States. Payment in U.S. funds (plus a $5.50 shipping/handling fee and applicable sales tax). Please allow four to four weeks for delivery.

Give Word a workout. $9.95.

We could've filled this page with the rave reviews critics have given new Microsoft® Word for Windows.™

But we thought you'd like to draw your own conclusions.

Introducing a Working Model that gets right down to work.

Try it with your everyday tasks. And experience just how powerful, just how easy, Word for Windows can really be.

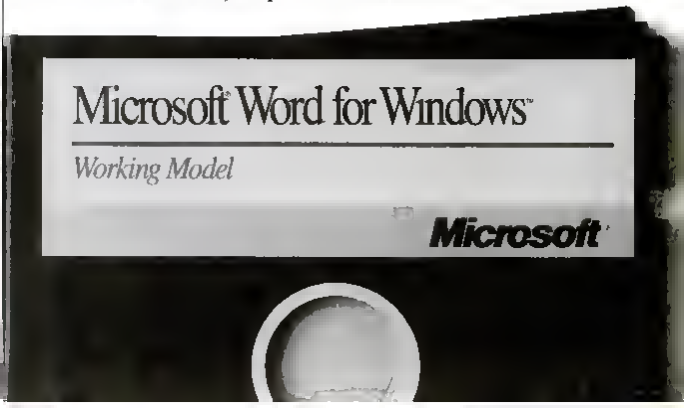

The Working Model is easy to install. It comes with a demo, sample documents and on-line help that's context-sensitive.

And all you need to get one is $9.95* and a telephone.

Then the sooner you call (800) 541-1261 and ask for Department L41, the sooner you can start giving Word a real workout.

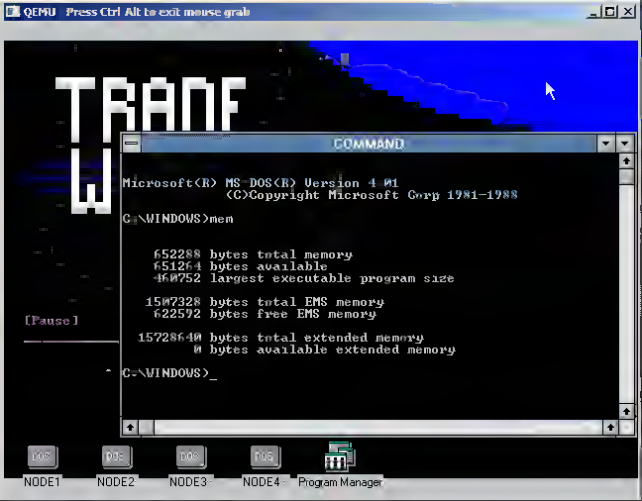

Microsoft
Making it all make sense.

*Plus $5.00 shipping & handling. Not available in conjunction with any other promotion or upgrade offer. Offer valid only in the United States and Canada. In the U.S. call (800) 541-1261. Outside the U.S. and Canada, call (206) 882-8661. © 1990 Microsoft Corporation. All rights reserved. Stacker Software
Proof of Purchase #_____
Please save for future reference

Co-processor System Requirements

- For all IBM and compatible '286, '386, '486, and Micro Channel systems with an open slot
- Compatible with DOS® 3 x, 4 x, 5 0, DR DOS 5 0, COMPAQ® DOS 3 31, and Windows® 3 0
- Requires 512K RAM for installation For resident device driver after installation 30K RAM without EMS, 14K RAM with EMS
- Compatible with Norton Utilities,® PC Tools Deluxe® and memory managers such as QEMM 386®

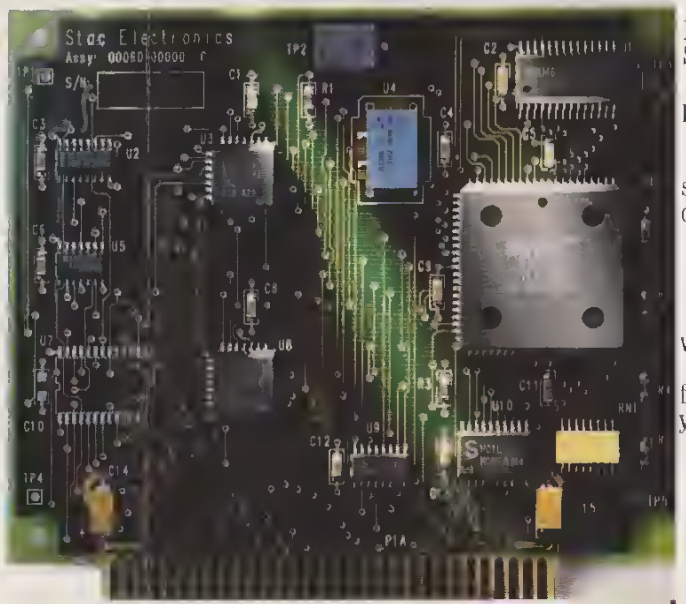

STAC

The Data Compression Company

5993 Avenida Encinas, Carlsbad CA 92008

You've doubled your capacity. Now increase your speed.

Trade up to a Stacker co-processor. Save up to $130.

If you like doubling your disk capacity with your new Stacker™ software, you're going to love this offer.

Because, for a limited time, you can improve your performance even more with a Stacker co-processor.

And save a lot of bucks while you're at it.

The Stacker co-processor is a half-sized board that does a lot more than double your capacity.

It boosts your disk throughput.

Reduces driver sizes.

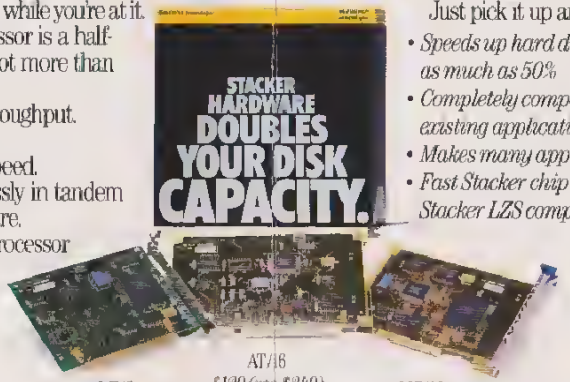

And increases your speed.

While working flawlessly in tandem with your Stacker software.

There's a Stacker co processor for your PC or XT. For your '286, '386 or '486 system. Your IBM® PS/2. Compatibles, too.

Installation is easy—all you need is an open PC slot and a screwdriver.

Ordering is easy, too—all you need is a phone. Just pick it up and dial 1-800 225 1128.

- *Speeds up hard disk throughput by as much as 50%*
- *Completely compatible with all your existing applications*
- *Makes many applications run faster*
- *Fast Stacker chip uses our patented Stacker LZS compression technology*
- *Installation is a snap. No jumpers or switches to set.*

XT/8 *$89 (reg $199)*

AT/16 *$129 (reg $249)*

MC/16 *$169 (reg $299)*

CALL TODAY. 1-800-225-1128.

OS/2 & DOS

UP TO 4 TIMES FASTER!

PROMOTIONAL COPY
NOT FOR RESALE

THE MOST DISK SPACE. GUARANTEED.

STACKER®

If you need more megabytes than your hard disk can swallow, don't buy a new drive. Stretch it with Stacker—the only proven data compression method with more than one million satisfied users.

Stacker sets the standard in real-time data compression as the fastest, most economical way to safely double your hard disk capacity without sacrificing DOS compatibility. It's fully compatible with Windows 3.0 and all your favorite disk utilities. And it's the only product of its kind that's available in both software and coprocessor versions.

- Increase storage 100%
- Compatible with DOS 3.x, 4.x, 5.x
- Industry's fastest real-time data compression
- Includes disk caching
- Fastest, easiest installation
- Toll-free technical support
- 90 day money-back guarantee

Plus, Stacker comes with a powerful disk caching program for added performance. Add the Stacker coprocessor card and you get the fastest data compression in the business.

So don't risk your data with anything less than the leader in data compression technology. Call Stacker today and double your disk capacity tomorrow. You can purchase the Stacker software-only version—perfect for laptops—for only $149. Or get the entire Stacker high performance system with software and coprocessor card for just $229. **Order today.**

Visa, MasterCard, American Express cards accepted.

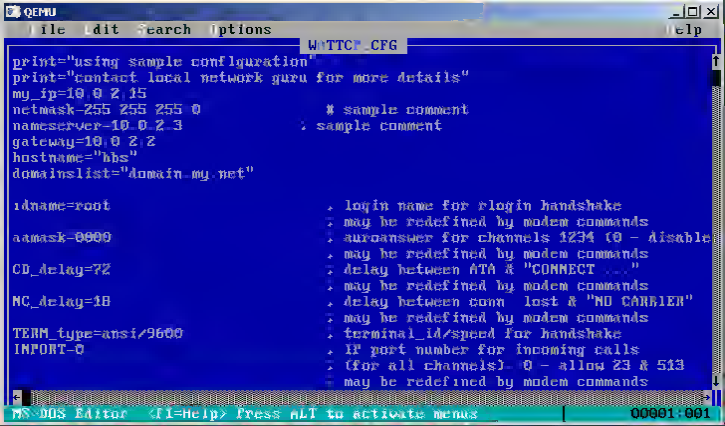

1-800-522-7822, X785

AMD Athlon

iPhone 4S

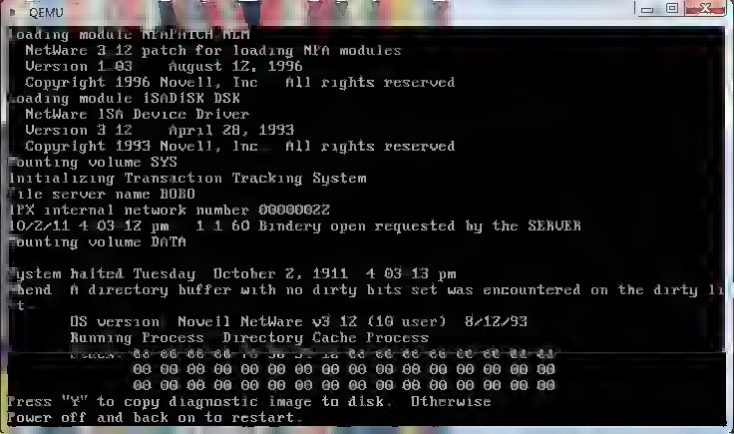

Dual-core A5 chip.
All-new 8MP camera and optics.
iOS 5 and iCloud.
And introducing Siri.

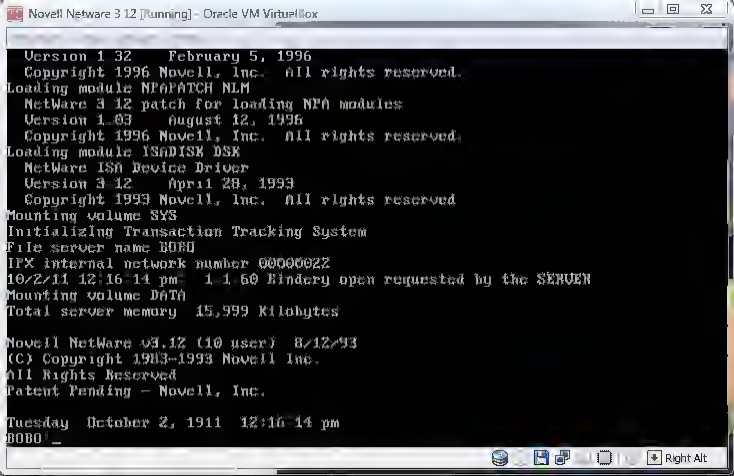

It's the most amazing iPhone yet

Steve Jobs

1955-2011

Apple has lost a visionary and creative genius, and the world has lost an amazing human being. Those of us who have been fortunate enough to know and work with Steve have lost a dear friend and an inspiring mentor. Steve leaves behind a company that only he could have built, and his spirit will forever be the foundation of Apple.

FOR **COMMODORE** PERSONAL COMPUTER USERS

Survivor

If you're quick of mind, eye, and hand, you might outfox your opponent. A two-player contest for the 64.

The Coordinator

Unlock the full creative potential of dazzling hi-res graphics on the Commodore 64 with this extraordinary multi-featured utility.

What's New Online

Going online is easier and better than ever—especially for Commodore users.

Also In This Issue:

128 Auto Boot
User Group Update
Software Reviews
And More

Cataloger

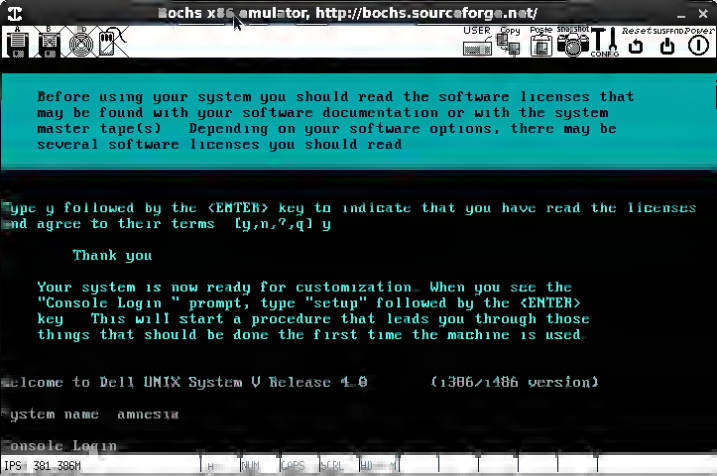

Organize your entire Commodore 128 or 64 disk library with this easy-to-use menu-based program.

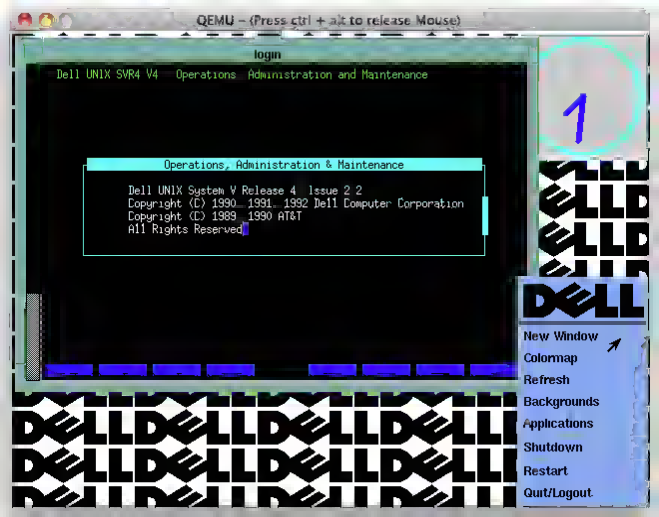

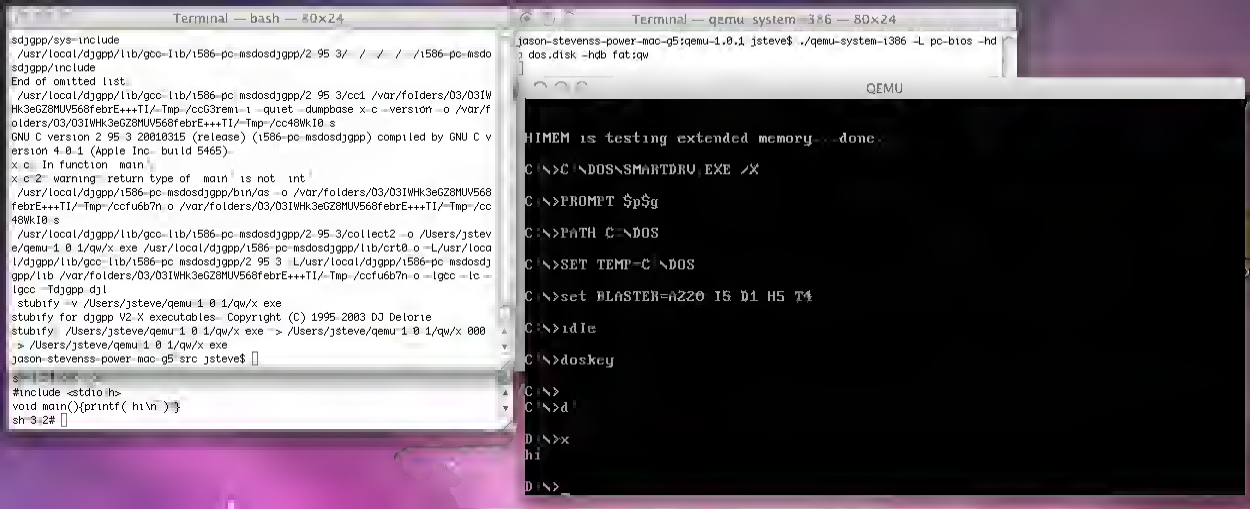

Number Construction Kit

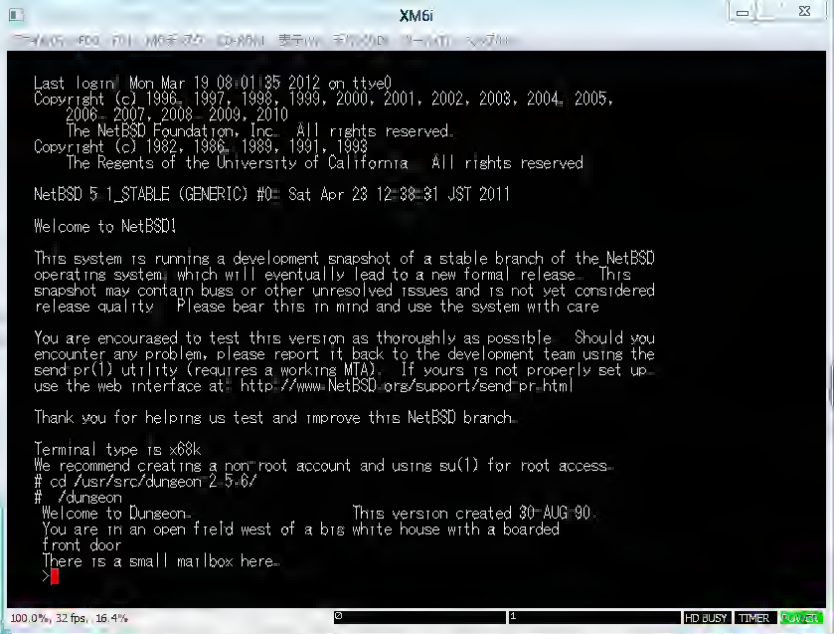

For children, here's an exciting way to practice and improve math skills. For adults, a real brain teaser. A clever educational tool for the Commodore 64, Plus/4, and 16.

NetBSD 5.1_STABLE (GENERIC) #0: Sat Apr 23 12:38:31 JST 2011
Welcome to NetBSD!
This system is running a development snapshot of a stable branch of the NetBSD
operating system, which will eventually lead to a new formal release. This
snapshot may contain bugs or other unresolved issues and is not yet considered
release quality. Please bear this in mind and use the system with care.
You are encouraged to test this version as thoroughly as possible. Should you
encounter any problem, please report it back to the development team using the
send-pr(1) utility (requires a working MTA). If yours is not properly set up,
use the web interface at: http://www.NetBSD.org/support/send-pr.html
Thank you for helping us test and improve this NetBSD branch.
Terminal type is x68k.
We recommend creating a non-root account and using su(1) for root access.
cd /usr/src/dungeon-2.5.6/
./dungeon
Welcome to Dungeon. This version created 30-AUG-90.
You are in an open field west of a big white house with a boarded
front door.
There is a small mailbox here.

DOS system running Lotus 1-2-3

SCO XENIX system running SCO Professional

THIS IS AN IBM PS/2 MODEL 80 RUNNING DOS

Under DOS, this PS/2™ is a powerful 80386-based single-tasking, single-user computer that can run thousands of DOS applications In 16-bit, 8086 mode.

One at a time

When OS/2™ software becomes available, the PS/2 can become a multitasking, single-user computer running in 16-bit, 286 mode that can also single-task those DOS applications under OS/2

One at a time.

With DOS or OS/2, the PS/2 will support one user

	1 user (DOS)	1 user (OS/2)
Cost per system**	$12,389	$12,594
Cost per user:	$12,389	$12,594

THIS IS AN IBM PS/2 MODEL 80 RUNNING SCO XENIX

Under SCO XENIX,® this PS/2 becomes a powerful 80386-based multitasking, multiuser computer that can run thousands of XENIX applications. In full-tilt, 32-bit, 386 mode

Many at a time.

And using SCO VP/ix,™* the PS/2 can multitask DOS applications under SCO XENIX.

Many at a time.

With SCO XENIX, the PS/2 will support one user Or 9 users. Or even 33 users.

And it can do all that today because you can get SCO XENIX for the PS/2—*now!*

	1 user	9 users	33 users
Cost per system**.	$14,559	$19,726	$40,402
Cost per user:	$14,559	$2,192	$1,224

SCO XENIX System V and the SCO XENIX family of software solutions are available for all industry-standard 8086-, 80286-, and 80386-based computers, and the IBM® Personal System/2™ Models 50, 60, and 80

Apr 9
EXIT

It's completely rational.

Microsoft® C/C++ 7.0 now includes the Windows™ operating system version 3.1 SDK. For only $139, it's hard to believe this development kit is so complete. We're talking all the latest technology programmers have told us they want.

But you're still skeptical. You're asking yourself what is missing? Well, here's an admittedly long-winded list of what's included.

Object linking and embedding. Great for creating applications that share diverse types of data, like text and graphics. An application that supports OLE can cooperate with other OLE applications, even those from another vendor.

Pen computing APIs. Everything you need to create compelling applications for the next generation of pen computers. There are over 300 pages of documentation that give you the basic elements of Windows for Pen Computing.

Multimedia APIs. Our newest media control interface. You can incorporate animation, audio and video capability using third party devices and drivers. (It's the next best thing to virtual reality.)

Windows Debugging Version. Traps the most troublesome UAEs and helps you create more stable, robust applications. Contains GDI, KERNEL, and USER modules.

GUI Setup Toolkit. It will make hammering out a custom Windows-based setup program as simple as writing a script file.

Microsoft Foundation Classes. Now you can use the same building blocks we're using to build future versions of the Windows operating system. A rich set of 60 recyclable object classes provides logical order to more than 500 functions of the Windows API. Menus, GDI, OLE 1.0 and advanced diagnostics support are included. Tasks such as registering Windows classes, building message loops, and managing device contexts are automatic.

Sample code. Over 75,000 lines.

Zoomin. A nifty tool for magnifying portions of a screen to help identify paint problems and other screen-related issues.

Heapwalker. Examine the global heap and local heaps used by active applications and dynamic-link libraries in your system.

Editors. And plenty of them. Dialog Editor lets you add, modify, and delete custom controls as you design and test dialog boxes on-screen. Image Editor modifies icons, bitmaps and cursors. Font Editor alters existing faces and creates new ones. Hotspot Editor creates and edits hypergraphics or bitmaps in one or more hotspots.

Spy Tools. Pssst. They make it possible to monitor Mouse, input/output from Windows, DDE and other messages between one or more Windows-based applications. You can also examine message parameter values.

Stress. Allows you to consume system resources for low-resource stress testing. Acquirable resources include the global heap, user heap, GDI heap, disk space and file handles. (Less job stress for you.)

Wdeb386. Now test and debug dynamic link libraries and Windows-based applications running in standard or 386-enhanced mode.

Multi-resolution bitmap compiler. Combine color and monochrome bitmaps with different resolutions into a single graphic.

Help Compiler. Create Help systems for applications that will take advantage of the new Windows 3.1 Help engine. Both context sensitive and topical searches of Help files.

Compiler features. Unrestricted pre-compiled headers for speedy throughput. Explicit or automatic inlining of any C/C++ code for faster executions. Compressed code for size reductions.

CodeView® Debugger. This window-oriented debugger is a powerful, easy to use tool for analyzing MS-DOS® or Windows-based program behavior. Test the execution and examine data all at the same time. Display any combination of variables—global or local—while you halt or trace a program's execution. Versions for dual and single monitor debugging, even in a window, are supported.

Source Profilers. Optimize the performance of all your MS-DOS-based or Windows based applications. Analyze your program to find code inefficiencies.

Whew! If you were to get all of this separately, it would cost many hundreds of dollars. And definitely will in the very near future.

On the other hand, if you use a Microsoft or any other C/C++ product, and order an upgrade before June 30, 1992, it's yours for $139. That includes over 5,000 pages of C/C++ 7.0 documentation plus the entire Windows 3.1 SDK online documentation. We'll also throw in a free copy of Qualitas' 386 Max™ for MS-DOS-based development.

And if you want the Windows 3.1 SDK documentation in hard copy (over 5,000 pages), it's yours for an additional $150.

Look. You can defy the logic of thinking programmers everywhere and pass up this historic offer. Or you can call your reseller. Or just call us at (800) 541-1261, Dept. B28.

Microsoft

It defies logic.

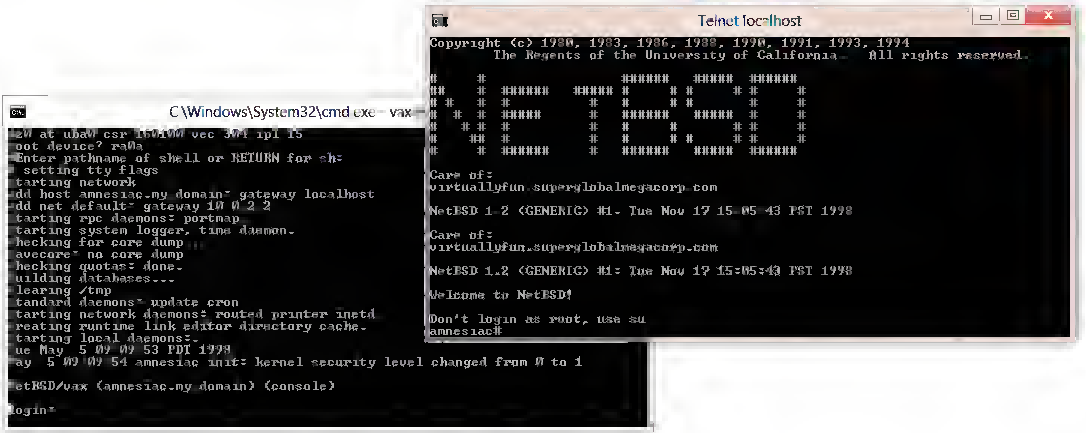

Offer ends June 30, 1992. Reseller price may vary. Offer good only for the U.S. United States. ©1992 Microsoft Corporation. All rights reserved. Printed in the U.S.A. Customers from the U.S. United States, call (800) 541-1261, Dept. B28. For information only. Outside the United States and (800) 426-9400 in Canada, call Trans-Ace-9400. Windows 2000 Setup
Upgrading to the Windows 2000 NTFS File System
Upgrading to NTFS is recommended
The NTFS file system gives you increased file security, more reliability and more efficient use of disk space. Your programs and files are not affected in any way. The upgrade occurs only on the drive where you are installing Windows 2000.
You should not upgrade your drive if you plan to install or use other operating systems on this computer such as MS-DOS, Windows 95 or Windows 98.
Do you want Setup to upgrade your drive to NTFS?
Yes, upgrade my drive
No, do not upgrade my drive

GO 16-BIT NOW — WE HAVE MADE IT EASY

8086

8 Mhz. 2-card CPU Set

$595

WITH 86-DOS®

ASSEMBLED, TESTED, GUARANTEED

With our 8-card 8086 CPU set you can upgrade your 8080 8-bit S-100 system to run three times as fast by swapping the CPU. It lets you use 16-bit memory — split right between as little as 64K of your standard 8-bit ram (or may be used for the 8-bit's if required by a program). A standard system draws 4 or 5 amps operation. Memory access requirements are 4 MHz supported and none.

The EPSON monitor allows you to display, alter, and search memory via ASCII and mnemonic, and boot your disk. Debugging aids include register display and change, single stepping, and execute with breakpoint.

The set includes a serial port with programmable baud rate, four independent programmable 16-bit timers (two may be used as a time-of-day clock), a parallel in and parallel out port, and an interrupt controller with 16 priorities. External interrupts may be applied to the timers to maintain the clock. Bootstrap system provided in rom. Total power 2 amps at +5V and 0.5 amps at +12V and -5V or at -12V.

The CPU card has 2 KB ROM, and is more than enough room for 16 additional sockets. It performs similar hardware such as console I/O, interrupts and servicing, and random or sequential read/write and verify to internal disk files. While it has a 4 MHz clock, it automatically performs similar wait-state jobs some additional CPU's & peripherals that normally require. Digital Research CP/M-86 is the operating system available in early configuration on 8" diskettes for hardware. Directly supported are the Tarbell and Cromemco disk controllers.

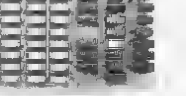

The 86-DOS™ package includes an 8086 assembler, assembler 8080 to 8086 source code translator (utility to aid translation of 8080 source code), conversion to 86-DOS format, a line editor and disk maintenance utilities. CP/M compatibility is the basis for the design, so it's best to accept 2KB source code within 8K CP/M. Translator has to 6000 source lines, assembler has 64K of memory, and the code generated is 8086 mnemonics and 16-DOS. This also is the conversion of any Z80 program for which source code is available to maintain the much higher performance 8086.

BASIC-86 by Microsoft is available for the 8086 at $600 (several firms are working on applied text programs. Call for current status at 8 a.m.).

All software licensed or use on a single computer only. Non-disclosure agreements required. Shipping from stock at 8 one week. Bank cards, personal checks, COD's okay. There's a 10-day $ refund privilege. All boards are guaranteed one year with parts and labor. Shipped prepaid by air in UPS and C.O.D. for Forces as address must be a street in US forces. Add add $6.00 per item for overseas air mail.

9/16 16-BIT MEMORY

This board was designed to be 8086. It is configured for 8 or 16 bits, and can be used by 8- or 16-bit processors. It operates at 8 or 4 MHz, and is used with 8- or 16-bit processors. The card contains switching a successful and in case it's the word saving of the address required, signal with full by 8- or 16-bit CPU boards. The card has 8 or 16 sockets, commonly has a word of two Erasable PLAS. PLAS can be used as address addressing. Erasable and existing ram. A memory for board select (maximum) and a memory access to give a finely addressable single block. Promptly by. For older systems, a switch will disable the card to use the top 8 address block. This word ensures that your memory board purchase will also be operable. It is guaranteed to run widely with all other CP/M CPU as using a Multi-stock. Standard memory kit: Prices 1 4, 5, 8, 16, 32, 64 @ 16-up $245

Scottie Computer Products, Inc.

8 Mhz 2-card CPU Set

Only $ is inquiry card.

Software Update

A new version of VMware Fusion is available!

VMware Fusion 5.0.0 is now available (you have 4.1.3).

Over 70 New Features

VMware Fusion 5 includes over 70 new features including support for Retina displays, notification center and USB3.0.

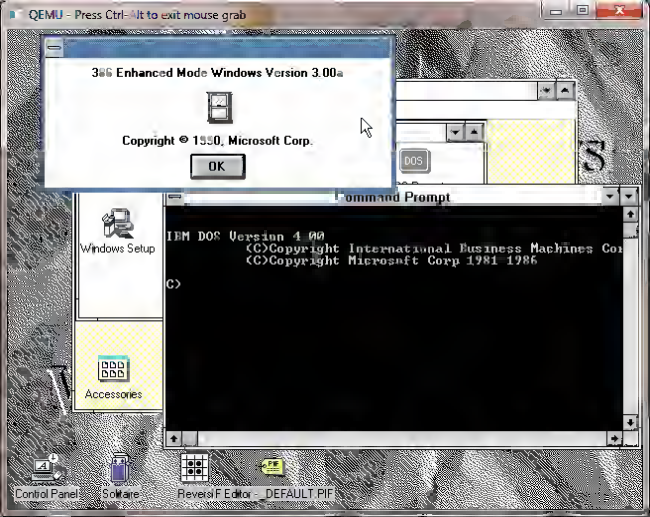

Now with Windows 8 Support

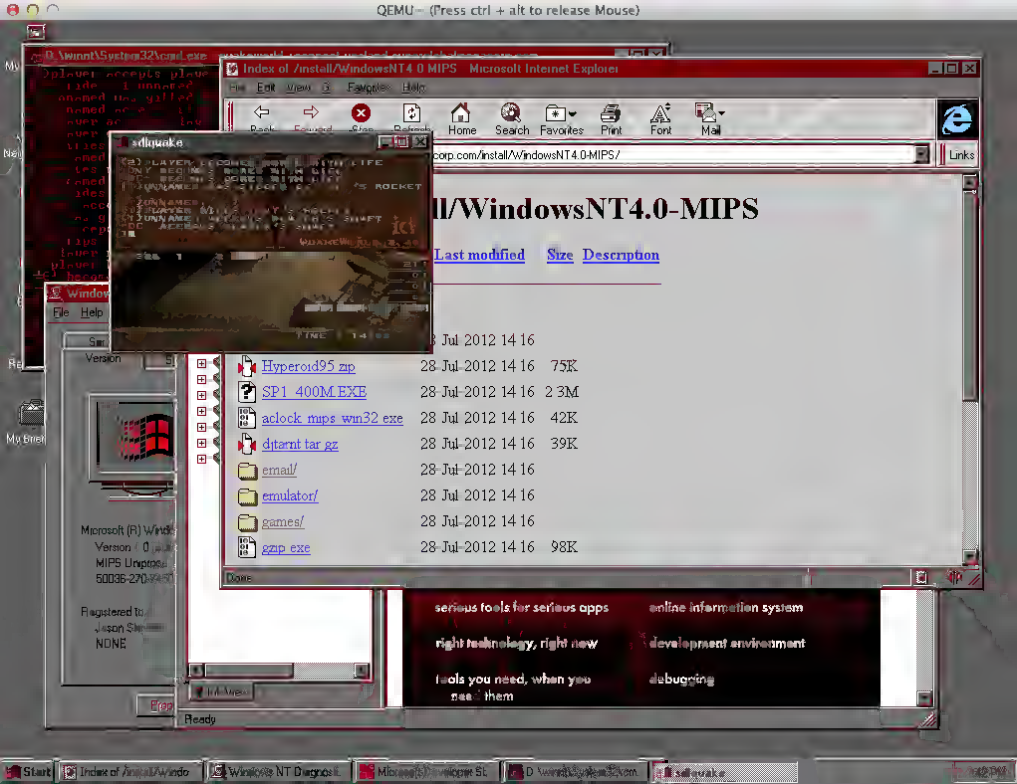

VMware Fusion 5 takes advantage of new capabilities in both Mountain Lion and Windows 8 to deliver an amazing Windows on Mac experience.

Up to 40% Faster

VMware Fusion 5 delivers up to 40% faster performance and 45% more battery life compared with VMware Fusion 4.

OS/2 2.0 SDK to Let Developers Start Writing 32-Bit Applications

BY STUART J. JOHNSTON

As promised, Microsoft began shipping the initial release of the Software Developer's Kit (SDK) for the first 32-bit version of OS/2® on the last business day of 1989.

The $2,400 SDK for OS/2 2.0 will let developers begin writing applications that take advantage of the Intel 386 and 486's linear addressing. This will eliminate 64k segment limitations imposed by earlier Intel chips and give developers the ability to write applications that use as much as 4 gigabytes of RAM or virtual memory.

However, OS/2 2.0 is not a complete 32-bit operating system but rather a hybrid 16-bit system that contains some 32-bit code in areas such as memory management routines. Some areas of the Presentation Manager's underlying graphics subsystem that are math-intensive have also been rewritten, the

See OS/2, Page 89

OS/2

Continued From Page 1

company said last summer. (See "First 80386 OS/2 Versions Will Be Hybrid 16-Bit Systems, August 7 1989 Page 8.)

"From the developers perspective, the exciting thing is it allows them to write and port 32-bit applications down from mainframes," said Cameron Myhrvold, Microsoft's OS/2 strategic marketing manager for ISVs. "We'll see a whole new range of applications being considered [for PCs]," he added.

Generally, corporate and commercial developers hailed the release of the 32-bit SDK as another incremental step toward what they view as OS/2's ultimate success as the PC operating system of choice for business.

"To not consider [OS/2 2.0] for corporatewide processing projects [corporate in house developers] are starting today is probably a serious mistake" said [illegible] technology evaluation analyst for Southern California Gas, in Los Angeles.

Besides the new system's 32 bit addressing scheme, developers said the ability to run multiple virtual DOS machines will be another plus for 2.0.

The 16-bit versions of OS/2 will continue to be supported for the "near and intermediate future" because 2.0 will not run on 16-bit 80286-based PCs, as 1.x versions will, Myhrvold said. "We're going to keep the shell programs and the interface the same, [between] the two versions," he said.

Neither will 286-based machines disappear from the office soon, Myhrvold added although he maintained that 386 and 486 machines "will be the platforms for innovation." Applications written for 16-bit versions of OS/2 will run unaltered under the new version he said. Version 2.0 will also run on 80386SX-based PCs, he said.

The initial SDK includes prereleases versions of OS/2 2.0, Presentation Manager tools, and 32 bit versions of C 5.1 and Macro Assembler 5.1. PM tools include [illegible] view and kernel debuggers that support 32-bit code. Some sample code will also be included, Myhrvold said.

Purchasers will also get access to Microsoft Online, the company's electronic bulletin board service for developers, until 90 days after availability of the final SDK release.

The SDK is currently only available from Microsoft and requires at least an 80386-based PC with 6 megabytes of RAM, EGA or VGA graphics, and a 60-megabyte hard disk. Group discounts of four SDKs are available for $8,500. No upgrade pricing is available for purchasers of earlier SDKs.

Microsoft is also "trying very hard" to include Apple's Royal Font technology in OS/2 2.0, Myhrvold said. The company plans to demonstrate the technology at a 2.0 conference on February 1.

It was unclear at press time whether the SDK will include the new 32-bit version of the High Performance File System (HPFS-386) that is to be released with LAN Manager 2.0, which Compaq is scheduled to [illegible] Manager HPFS Hurlinger of OS/2 386," November 13, 1989, Page 1.)

First 80386 OS/2 Versions Will Be Hybrid 16-Bit Systems

BY STUART J. JOHNSTON

The first versions of an 80386-specific OS/2 will actually be hybrid 16-bit systems rather than completely 32-bit implementations, Microsoft has revealed.

OS/2, Version 2.0, which is scheduled to reach end-users next year, will change some application programming interfaces (APIs) to take advantage of the 80386's capability to have memory segments larger than 64K, as the company promised in February (See 'Other Firms May Get IBM OS/2 EE," February 27, Page 1.)

However, the entire operating system will not be completely rewritten to use the chip's 32-bit architecture initially, according to Peter Neupert, Microsoft's senior general manager for OS/2.

"We will go [first] for the things that are the big wins — memory management, paging, and the large linear address space," Neupert said. It will be "two or three releases" before the operating system completely migrates to 32-bit architecture, he added.

OS/2 2.0 will include changes to several memory management APIs that will eliminate the 64K size limits on memory segments — a restriction imposed on DOS and OS/2 by the 16-bit addressing scheme used in the Intel 8088 and 80286.

The 32-bit 80386 allows segments to be as large as 4 gigabytes, which would make many tasks, such as manipulating large amounts of data, simpler for programmers if OS/2 also supported that. However, current versions of OS/2 were written for the 80286.

Changes in the memory management APIs will let developers address memory as a continuous linear area instead of as 64K chunks.

Another change will let OS/2 2.0 handle memory swapping in 4K pages instead of as segments. "We think [swapping] will be quite a bit faster on the 386," Neupert said.

While these are the only changes that Microsoft promised for Version 2.0, portions of the Presentation Manager's underlying graphics subsystem are also being rewritten. "To take advantage of 32-bit arithmetic, we have redone routines that are CPU-bound," Neupert said.

"In a perfect world, a complete native 32-bit implementation will be best — but you're still going to have a mapping layer to make 16-bit applications run," Neupert said. Microsoft's choices were based on the cost-to-performance benefits as well as the time to get the product to market, he added.

The new version, due to ship to developers this year runs 16-bit OS/2 applications without modification, Neupert added. While Version 2.0 uses a mapping facility to translate between 16- and 32-bit code, he downplayed the possibility of performance impact.

"It's not going to be a big deal for users or developers," Neupert said.

One area that will not change is the new High Performance File System (HPFS) that will ship with OS/2 1.2 in September and will also be in Version 2.0. The 16-bit HPFS will not be modified, at least initially because "it's not normally CPU-bound but disk-bound," Neupert said. "There will be 32-bit APIs for the file system which will be mapped down."

First 80386 OS/2 Versions Will Be Hybrid 16-Bit Systems

Overview of Functions

You can combine the convenience of a personal computer with the resources of a host computer by linking them together.

To do this, you can have your computer act like, or emulate, a terminal normally used with the host computer.

Main Menu: Introducing OS/2 Extended Edition
Keyboard Users: To make a selection, use the arrow keys to position the cursor on an item; then press the Enter key.
Mouse Users: To make a selection, position the pointer on an item and press and release (click) button 1.
1. Introducing the Base Operating System
2. Introducing Communications Manager
3. Introducing Database Manager
4. Introducing LAN Requester and OS/2 LAN Server

QNX 2.15
Jan 1 12:00:24 am
What type of hard disk controller do you have?
1 - XT
2 - AT (non caching driver)
3 - AT at 10MHz or faster (caching driver)
4 - PS/2 (model 25 or 30 not model 30 286)
5 - PS/2 with ST506 drive (model 50, 60 70 or 80)
6 - PS/2 with ESDI drive (model 60 70 or 80 with disk >= 60 MB)
7 - OMTI 0620/0627
8 - ROM BIOS compatible interface (int 13h NOT for protected mode!)
NOTE: Drivers 3 5 6 and 7 are high performance caching drivers They
do both read ahead and write behind After a write always wait 5
seconds before rebooting or turning power off to allow time for the
cache to flush to disk
Driver 3 may be used with any AT but we recommend it for faster
machines Your disk interleave should be the same as used by DOS
if you use this driver
Enter a single digit to indicate the controller? 3
Step 1a - Execute mount disk 3 /drivers/disk.atc
is your drive 427 Megabytes containing
820 tracks, 16 heads and 63 sectors/track (y/n)? y

QNX 2.15
QNX HARD DISK INSTALLATION PROGRAM Jan 1 12:09:29 am
This hard disk installation program should cover 95% of all installations. The program does not perform the installation itself but invokes a set of standard QNX utility commands to perform each step. These steps are described in Chapter 3 of the QNX Manual. Feel free to follow through the manual for more information if you are interested
If you are upgrading from an earlier version of QNX then STOP NOW or your existing QNX partition will be replaced. Follow the instructions on the supplied sheets for upgrading to QNX 2.1x
If you wish to share your disk with DOS we recommend that you install DOS first
If you run into problems not covered in the manual, you may call the QNX technical support line for help
Technical Support
(613) 591-0941 (9:30 am to 5:30pm EST)
You may abort this program at any time by pressing the keys CTRL SCROLL LOCK
Press ↵ to continue
To direct input to this VM, click inside or press Ctrl+G.

QNX 2.15
Jan 1 12:02:00 am
QNX comes in both real and protected mode. You must select which version you wish to boot from hard disk. You may change your mind later. Protected mode operating systems may only be run on AT or PS/2 class machines. They allow access to extended (> 1 Megabyte) memory. The suffix on the operating system names have the following meanings
pcat - IBM PC, AT, PS/2 or compatible running in real mode
atp - IBM AT, PS/2 or compatible running in protected mode
A: os 2 15Cpcat
B: os 2 15Catp
Type the letter of the operating system you want? _
To direct input to this VM, click inside or press Ctrl+G.

QNX 2.15
Jan 1 12:02:49 am
These options need to know what type of video adaptor you have for the console screen. if you have an EGA card which can do EGA graphics on a monochrome screen (only a few do) specify EGA if you have an EGA card configured for hercules graphics on a monochrome screen specify HGA
m - monochrome display adaptor (MDA)
h - hercules graphics adaptor (HGA)
c - colour graphics adaptor (CGA)
e - enhanced graphics adaptor (EGA)
v - ps/2 graphics adaptor (VGA)
What type of monitor do you have (m/c/h/e/v) ? v
If you have a HGA/CGA/EGA/VGA adaptor you can use the QNX graphics library
Will you be using programs that run in graphics mode (y/n)? y
On an EGA screen, QNX supports two text modes. The standard 25 by 80 and an extended 43 by 80. A VGA supports both these modes and one which is 50 by 80
The STTY command has a rows= option to allow you to switch. The full screen editor will switch when you type ALT z (for zoom)
Do you wish to use the extended text mode (y/n)? y
Would you like cyan characters (y/n)? _
To direct input to this VM, click inside or press Ctrl+G.

Open Look Workspace Manager/OLWM
New Features
Requires QW 1 9 9
1 Supports the Open Look Window Properties A new item
now appears on the Window Menu called Properties
This option lets you specify
- Initial window state (Window Icon Full)
- Initial icon location
- Initial window location
- Initial window size (for resizable windows)
Select Apply to make the changes permanent The
%next% time the application starts it will use
these values to determine how the application
window should start-up
Applications must use the new library routines
in order to support window properties See
puzzle c clipboard c and makefile for examples
2 Supports olwm init as an executable shell file
for auto-starting applications in QNX Windows
To use create a file in your windows configuration
olwm : 26% +- PgUp PgDn Home End Tab ? /Find Esc

Introducing Your Desktop

Everything on your screen is part of your desktop, which includes many features to make your work easier. This introduction presents the basic skills you need to start using your desktop.

As you begin this introduction, position the mouse with its cord pointing away from you.

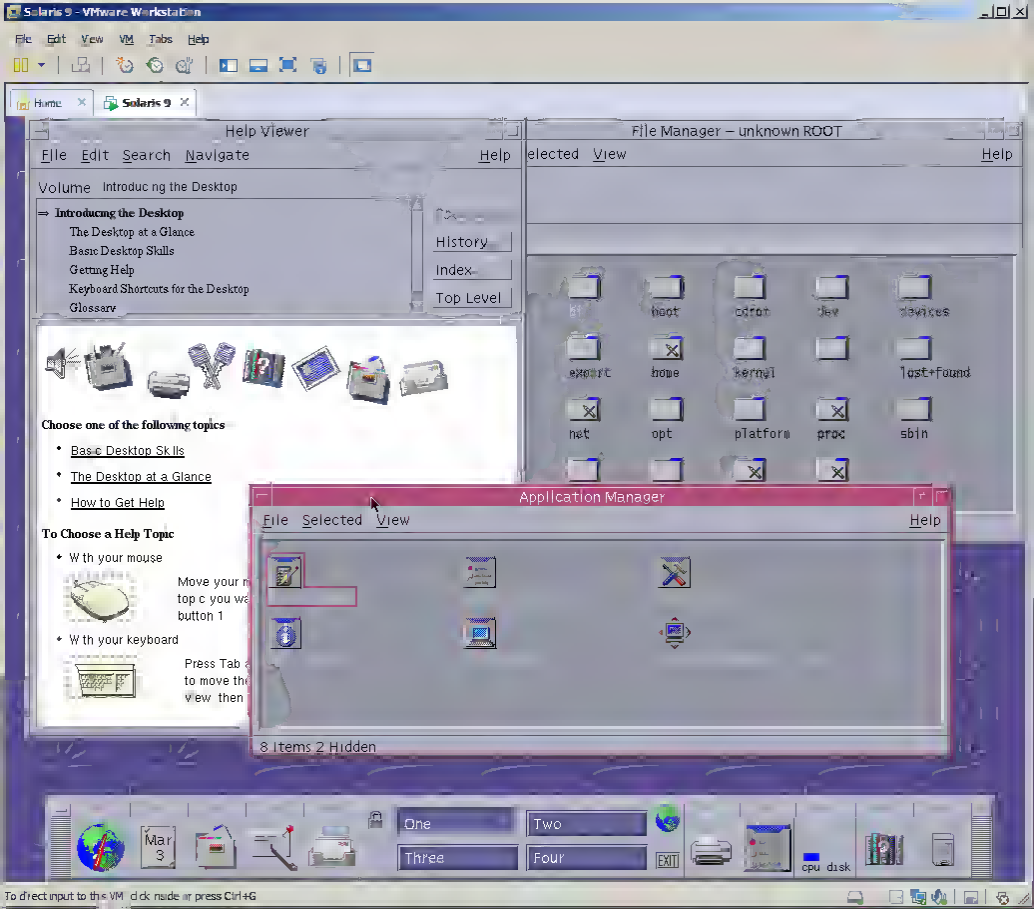

Move the mouse. Notice how each movement is reflected by a black, arrow-shaped pointer on the screen.

[Resident Monitor] A:\>?
External commands are loaded automatically, similar to DOS command. The file
extension must be 6XE, 6XS, 601, or 6MG. For 6MG files, an eprom image is
assumed. The file is loaded at location 400000, and control is transferred to
location 400100. For 601 files, an application is assumed. The file is loaded
at location 400000, and control is transferred to location 400000. 6XF and 6XS
are used by the Firmware. Batch commands end in 6MD.
There are a number of internal commands supported. To obtain help for an
internal command, type the command name followed by a ?. The internal commands
supported are:
help, date, time, mode, font, fdisk, vdisk
dir, copy, erase, cd, mkdir, rmdir,
in, out, fill, dump, search, call,
load, read, write, boot, reboot,
debug, break, monitor, regs, sregs, go, step, pstep, disasm,
rem, echo, goto, sleep
To change the current drive, enter <drive-letter>.
The resident monitor attempts to load internal commands first, using the
minimum number of unique characters. To override this action and force the
loading of an external command, enter path and/or drive information

Simple Network Diagram

username *user* password 7 12090404011C03162E

Take the type 7 password, such as the text above in red, and paste it into the box below and click "Crack Password"

What's the moral of the story?

Don't use the old type 7 passwords anymore. Use the new "secret" keyword only. For example:

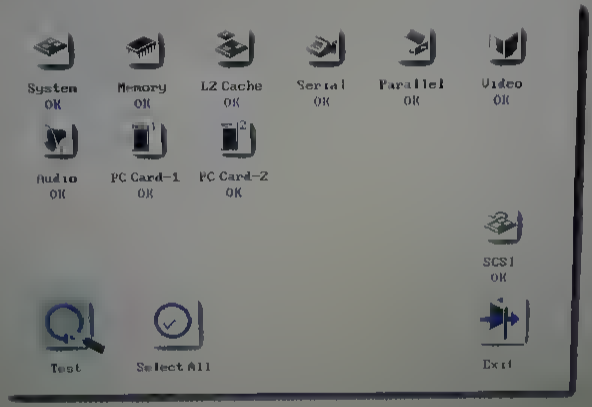

```
enable secret password
...
username user secret password
```

File Edit Options Help

API NOTES:

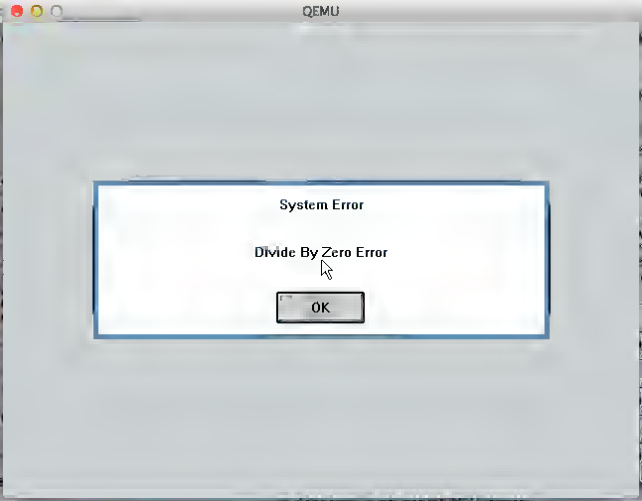

a When IMPORTing a system API into your source code you should do so using only the ORDINAL for the function, not the name. Ordinals for each API are given in the file BSEORD.H This rule will be fully enforced in a future release of the SDK

b The 32-bit MLE (Multi-Line Edit) APIs are not fully implemented in this release of the SDK

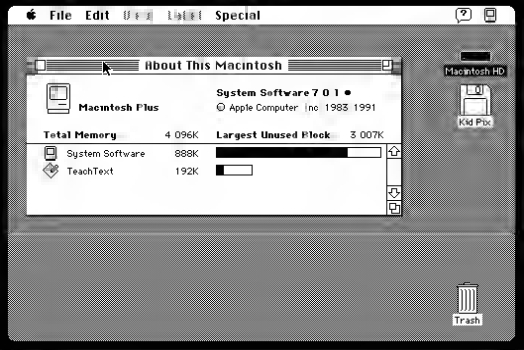

c The 32-bit version of the WinAddSwitchEntry API is not working in this release of the SDK

d The constants used for the INCL_DOSDEVICES class of API in bsedos.h and bsedos16.h have been changed since the first SDK, as promised in the earlier readme file The definitions are now equivalent to those used in the OS/2 1.2 Toolkit.

e If an application is to remain 16-bit it should be compiled and linked with the 1.2 toolkit header files and libraries If it is compiled with a 16-bit compiler (c5.1/c5.2/c6.0) and OS/2 2.0 SDK header files, and linked with the 2.0 SDK's libraries, it is probable that the application will have

.NET Framework
The .NET Framework is the infrastructure for the overall .NET Platform. It includes base class libraries, like ADO.NET and ASP.NET, as well as a common language runtime.
XML Web Services
An XML Web service is a unit of application logic providing data and services to other applications. Applications access XML Web services via standard Internet protocols and data formats such as HTTP, XML, and SOAP.
Microsoft Visual Studio .NET
1 2608 2 Failed LookupAccountNameW 80070534
OK
Language Enhancements
Visual Studio .NET 2003 includes updated versions of Visual Basic .NET and Visual C++, as well as a new programming language, Visual C#. Learn more about the new features of these languages.
Tools for Developing for Devices
Visual Studio .NET provides support for the .NET Compact Framework, enabling you to use your Visual Studio .NET skills to easily program Pocket PCs and Windows CE .NET Powered devices using Visual Basic .NET or Visual C# .NET. Visual Studio .NET also includes integrated ASP.NET mobile controls that work with more than 150 Internet-enabled mobile devices.

DEV-S7L250IKH7H

DEV-S7L250IKH7H VMware vCenter Server, 5.5.0, 1312298

Getting Started

1 Create a datacenter — Add a host — Add a virtual machine — Complete set up

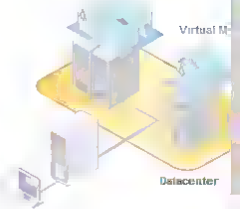

Welcome to vCenter Server

You're ready to set up vCenter Server. The first step is creating a datacenter.

A datacenter contains all inventory objects such as hosts and virtual machines. You might need only one datacenter. Large companies might use multiple datacenters to represent organizational units in their enterprise.

To get started, click Create a datacenter.

Create a datacenter

From today's featured article

Jimi Hendrix (1942–1970) was an American musician, singer, and songwriter. Despite a relatively brief mainstream career spanning four years, he is widely regarded as one of the most influential electric guitarists in the history of popular music, and one of the most celebrated musicians of the 20th century. Born in Seattle, Washington, Hendrix began playing guitar at the age of 15. In 1963, he moved to Clarksville, Tennessee, and began playing gigs on the chitlin' circuit, eventually moving to England in late 1966, after being discovered by bassist Chas Chandler of the Animals. Within months, Hendrix had earned three UK top-ten hits with the Jimi Hendrix Experience: "Hey Joe", "Purple Haze", and "The Wind Cries Mary". He achieved fame in the US after his performance at the Monterey Pop Festival in 1967, and in 1968 his third and final studio album, *Electric Ladyland*, reached number one in the US. The world's highest-paid performer, he headlined the Woodstock Festival in 1969 and the Isle of Wight Festival in 1970 before dying from barbiturate-related asphyxia on September 18, 1970, at the age of 27. **(Full article...)**

The AMIGA
PERSONAL COMPUTER

Its speed and colorful graphics come from a 68000 and sophisticated custom chips.

Editor's note: The following is a BYTE product review. It is not a review in the strictest or editorial sense of this new product because we feel it is significant. A complete review will follow in a subsequent issue.

THERE ARE TWO ways to get work done inside a computer: do it in software or do it in hardware. The latter usually gives you unlimited flexibility, fast object speed. The Apple Macintosh and most almost everything by software—and

Photo 1: The Amiga Personal Computer. The graphics on the display are a result of the Workbench user model.

Los Angeles im Jahre 2029...

Jeder dachte, der Holocaust sei mit der Zerstörung der Orbitalplattform beendet gewesen.

Aber man hatte sich getäuscht...

SKYNET plante den Weltuntergang. Und Du mußt in die Vergangenheit reisen, um die Zukunft zu verändern.

THE TERMINATOR RAMPAGE

- *Ein wahres PC-Erlebnis in der Virtuellen Realität*
- *Die erste 3D-Simulation mit voller Bildschirmauflösung und 360° Drehung!*
- *Spektakuläre Grafik, Musik und Soundeffekte!*

Die aufregendste und spannendste Action-Simulation, die es je gab!

Zerstöre die Meschieen, bevor diese die Menschheit vernichtee.

Für IBM MS-DOS Rechner und 100% kompatible mit VGA Grafik

Minimalanforderungen: 386 CPU/25 MHz 4MB Ram (2MB Expanded Memory) 18 MB Freiraum auf der Festplatte und eine VGA Grafikkarte.

Empfohlene Ausstattung: 386 CPU/33 MHz (besser Intel 486 CPU/33 MHz) Microsoft Maus (oder 100% kompatible) und zwei Soundkarte

Unterstützung für: Joystick, Maxecom Maus und die (Flagship) Cybermax Maus MultiMediaMaxNet Kamm Ans. Ensoniq, Roland Soundblaster und Silmaster

A Game of Thrones

Book One of A Song of Ice and Fire

By George R R Martin

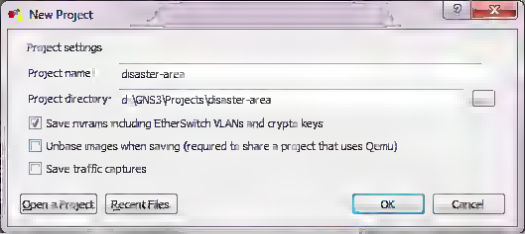

PROLOGUE

"We should start back," Gared urged as the woods began to grow dark around them+

"Do the dead frighten you?" Ser Waymar Royce asked with just the hint of a smil+

Gared did not rise to the bait. He was an old man, past fifty, and he had seen +

"Are they dead?" Royce asked softly. "What proof have we?"

Power Programming

A Sneak Preview Of the 32-Bit Version of OS/2: 2.0

■ Virtual-86 Mode for multiple DOS boxes that multitask and use EMS, windows, and memory management through paging highlight the new 32-bit OS/2 2.0.

OS/2 2.0, the long awaited 32-bit, 80386-specific version of the OS/2 operating system, reached developers in early January 1990. The changes and new features it includes answer virtually all the objections that critics have raised about the original 16-bit versions. But even if the technical excellence of the system can no longer reasonably be questioned, the fate of OS/2 as the successor to DOS still hangs in the balance. It remains to be seen whether OS/2 2.0 will entice enough users away from DOS or become the dominant force in the shrink-wrapped software market. If not, OS/2, like Unix, will remain a niche operating system for workstations, network servers, and power users.

In mid-1990, and the next installment of Power Programming, we'll survey new features of OS/2 2.0 to several levels. Then, in succeeding columns, we'll address specific issues involved in turning existing 16-bit OS/2 applications into true 32-bit applications. The descriptions and follow-apply specifically to the first beta-test version of OS/2 2.0, called Build 6.43 and dated 09/12/89. The system might have undergone significant changes even before you read this column, and I'm certain that many important aspects of OS/2 2.0 will change before its retail release, perhaps as early as the fourth quarter of 1990.

THE OS/2 2.0 SDK

The initial release of the OS/2 2.0 Software Development Kit must set some kind of record for systems-level programming tools. The original $3,000 Microsoft OS/2 1.0 SDK was a hefty beast, it arrived in a 3-foot box containing over 30 pounds of manuals and other paraphernalia. The $2,600 OS/2 2.0 SDK, by contrast, consists of only sixteen 5.25-inch 1.2 MB diskettes and a half-dozen Xeroxed sheets of installation notes; the whole weighs a grand total of ten ounces! While the folks who designed the earlier OS/2 1.0 SDK were clearly refugees from DEC's VAX VMS documentation division, I can't but wonder whether the people who put together the OS/2 2.0 SDK were recruited from a Zen monastery.

Installing the SDK is a laborious process, it requires about an hour. The diskettes are divided into three groups: the operating system itself; the programming tools and the toolkit, which includes various OS/2 API header files, libraries, utilities, and a few sample programs. Installation of the operating system proper takes about 30 minutes if everything goes well, but the installation program is rather touchy and can fail midway for any number of reasons. It took me three tries to get a working system, even though I'm a veteran who has installed more alpha, beta, and retail versions of OS/2 than I care to think about. But once the operating system is up and running, installation of the other two sets of disks is straightforward. Simply place the first disk of each set in A: and run the SETUP batch file.

After loading all the diskettes onto your hard disk, you find yourself with a mountain of on-line documentation to struggle through. The OS/2 user command reference, an overview of OS/2 2.0's new features, the kernel and Presentation Manager Application Program Interface (API) reference, the application Style Guide, and the Information Presentation Facility Compiler reference are supplied in the form of IBM Information Presentation Facility (*.INF) files. These you read with the IPF viewer (VIEW.EXE), which is a graphics-based Presentation Manager application. On the other hand, the documentation for the programming tools is supplied in the form of QuickHelp (*.HLP) files. These are accessed with the Microsoft QuickHelp utility (QH.EXE), which is a character-based application and can be run in a FM window.

In all, the OS/2 2.0 on-line documentation files add up to 16 least several megabytes of text. Since it isn't available in printed form, you can't study it in any organized way. When you're desperate to learn something, you must simply cursor around to QuickHelp or IPF until you stumble onto the information you need. If you've got the patience, you can methodically paste the contents of each topic into a file and create your own printed documentation. Unfortunately, however, the IPF has some nasty bugs and cause it to drop words out of the pasted text, so your chances of getting a usable API reference even by this laborious route are not very good. Let's hope and Microsoft and IBM at least get all the documentation converted to a single presentation format in the next SDK 2.0 update.

The programming tools supplied with the SDK include the 80386 versions of Microsoft C, MASM, LINK, and *CodeView* 3.0, and such usual auxiliary programs as the Resource Compiler, Dialog Editor, Font Editor, Icon Editor, MAKEKEXE, MAKE, Microsoft Programmer's Editor, and QuickHelp. Also supplied is a debugging version of the OS/2 2.0 kernel and sends status and error messages out through the serial port. Although they generate or manipulate 32-bit object code and executables, nearly all of the programming tools are 16-bit protected-mode programs. This lets you use them for cross-development: you can maintain source code and build 32-bit applications on a tried-and-true OS/2 1.2 system and then simply move the final executables to your OS/2 2.0 system for testing.

We can all be eternally grateful that the SDK is a joint project of Microsoft and IBM, and all SDK manufacturing, shipping, and technical support is handled by a single site (Microsoft). This arrangement is far preferable to and used with the original OS/2 1.0 SDK. At that time, Microsoft and IBM apparently believed themselves to be in some sort of silly competition for the hearts and minds of OS/2 developers. So both companies released separate SDKs that were never quite in sync and whose documentation, tools, header files, and sample programs differed sometimes subtly and sometimes wildly. As a result, many developers felt obliged to buy both versions of the OS/2 1.0 SDK in order not to miss anything. And they spent enormous amounts of time and money tracking the updates of each SDK and analyzing the differences between them. I'm relieved to see that Microsoft and IBM have decided not to repeat that fiasco.

OS/2 2.0 AND THE USER

From the user's point of view, the SDK version of OS/2 2.0 looks remarkably like that of OS/2 1.2. The installation process is virtually identical, the appearance of the Desktop Manager, File Manager, Task Switcher, icons, scroll bars, and so on are essentially unchanged, and OS/2 2.0 uncomplainingly runs all OS/2 1.2 applications—even those that use such new OS/2 1.2 features as color icons, long filenames, and extended attributes.

Of the main differences between OS/2 1.2 and 2.0, the most obvious ones relate to the DOS Compatibility Environment, or DOS Box. Unlike the 16-bit 286 versions of OS/2, which supported only a single DOS Box, OS/2 2.0 permits multiple DOS Boxes to be active simultaneously. Moreover, DOS applications may be run either in a window or full-screen, even when they are displaying graphics. Refer to Figure 1 for an example. Like protected-mode applications, the DOS Boxes themselves are now multitasked and swappable, and they continue to receive CPU cycles when they are in the background. Real-mode programs and batch files can be launched directly from the Program Starter or protected-mode command line sessions. OS/2 2.0 automatically fires up a new real mode session on demand. The user can cut and paste text from one DOS window or another, and can cut and paste text or graphics from a DOS window into a PM window. OS/2 2.0 can even provide EMS memory to real mode applications on demand, and the amount of EMS memory available to each DOS Box is under the user's control. (This prevents greedy spreadsheets from gobbling up all the physical memory and disk swap space.)

When you run CHKDSK in an OS/2 2.0 DOS Box, you're in for a pleasant surprise. In the beta version, CHKDSK shows 624K available in each DOS Box—far more than was available in OS/2 1.2 (approximately 500K) or in any recent version of MS-DOS itself. Yet the compatibility of the DOS Boxes with DOS applications is excellent. This is because the MS-DOS emulator module loaded into each DOS Box was derived directly from the MS DOS 4.0 source code after removing the file system and other services that must be handled by the OS/2 kernel.

OS/2 2.0 can safely multitask real-mode programs and can window their graphical displays because it exploits the special 386 subset of protected-mode operations known as Virtual 86 Mode. A DOS program running in a session called a "Virtual 86 Machine" can't detect any difference from 8086/88 real mode. It simply sees a 1MB address space and can play all the usual tricks, such as stuffing arbitrary paragraph addresses into segment registers. The operating system however, retains a degree of control over the application that it could never exert over a program that was actually running in real mode. Thus, lets OS/2 2.0 safely execute ill-behaved DOS applications that might crash OS/2 1.2 or that would not run on OS/2 1.2's DOS Box at all.

In Virtual 86 Mode the operating system can, if it chooses, trap some or all of the real mode application's I/O port reads and writes, the execution of sensitive instructions, and references to memory ad-

Figure 1 Multiple DOS applications can run simultaneously under OS/2 2.0. The applications are preemptively multitasked, their memory is swappable, and you can cut and paste text and graphics from a DOS application into a true PM application. OS/2 2.0 exploits the 386's Virtual 86 Mode, so it will run graphical DOS applications in a PM window.

dresses outside the DOS address space (such as direct writes to the video refresh buffers). The Operating System can then decide selectively which of these operations should be allowed to proceed unchanged, which should be translated (by substituting one memory address for another, for example), and which should be carried out by the operating system on the application's behalf. The operating system can also decide to "mirror" certain interrupts into the Virtual 86 Machine. This allows an MS-DOS communications program to run under the impression that it is in complete control of the serial port, for example. This process of filtering all hardware accesses in a fashion invisible to the application is called *device virtualization*.

OS/2 2.0 SYSTEM ARCHITECTURE

At the architectural level, Version 2.0 is an obvious descendant of its 16-bit predecessors. It supports essentially the same graphics engine, networking, multitasking, and interprocess communications facilities. It is built from the same basic components: installable device drivers and file systems; the OS/2 kernel; a host of dynamic link libraries; and the PM Shell.

However, in just as many ways OS/2 2.0 seems like a new operating system that happens to run DOS and 16-bit OS/2 applications. Many of the basic system components have been rewritten or heavily overhauled in a release of various limits on system objects and resources that were present in the 16-bit version. For example, OS/2 2.0 supports no less than 4,096 threads of execution, 4,096 processes, 32K of simultaneously open files, and devices extended interrupt sets larger than 64K, and about 3,000 named pipes. It also supports a new type of executable file whose header uses the identifier LE instead of the previous NE or MZ.

The most far-reaching architectural improvement in OS/2 2.0 is its use of the 80386's paging unit for virtual memory management. Gone is the segment motion and segment swapping used in the 286 version of OS/2. Memory is always allocated and swapped in units of 4K pages. This generally improves throughput because small working sets of pages will tend to stay in memory for all active applications. A single application no longer runs the risk of having its entire code segment discarded or its entire data segment rolled out to disk just because another process asked for a few kilobytes of memory and all physical memory was already in use.

OS/2 2.0 32-bit applications are programmed in a *flat* address space model, eliminating at one stroke the plethora of memory models and runtime libraries that has plagued 16-bit 80x86 programming. A 32-bit application is like an MS-DOS .COM program (which used the tiny model with CS=DS=ES=SS), with the exception that the address space in which it lives is 4GB instead of 64K. Of course, since the 32-bit application is running in protected mode, all segment registers must be loaded with valid selectors. But only two selectors (and thus two descriptors) need be involved: an executable/readable selector in CS and a data read/write selector in DS, ES, FS, GS, and SS. The descriptors for these two selectors map to the same memory.

Within the 4GB segment, shown in Figure 2, the application code and data reside at the low end, and the operating system is mapped into the segment at the high end, with the application's stack(s) and local heap floating in between. Thus all calls and jumps are "near" in nature. But this in itself doesn't save memory, since most of the jumps and calls will be 5 bytes long (an opcode byte and a 32-bit offset)—the same length as a far call or far jump in 16-bit protected mode. Write-protection of code and constant data is enforced at the page-table level rather than at the segment level used by the 286 version of OS/2. Thus together with the 4K granularity of memory allocation, allows 32-bit applications to play host to whole new classes of bugs unknown in 16-bit protected mode.

While the operating system and application live in the same flat address space, the operating system protects itself from the application. The memory manager sets up ring 0 and ring 3 CS and DS selectors whose descriptors differ only in their *limit* (segment length) fields. The ring 3 selectors map only the lower end of the address space, which contains application code and data, while the ring 0 selectors map everything. If the application tries to touch high memory, the result is a GP fault, but when it calls an OS/2 entry point, an automatic switch in privilege levels lets the operating system access any location in the 4GB address space.

Although the unit of memory currency is not the selector—the system deals in memory *objects* that usually act like segments. The difference is that the *handle* of an object is its 32-bit base offset, rather than a selector which cannot be arithmetically manipulated and to which an offset must be appended. The system switches addressing contexts from one application to another and arranges for memory objects to be shared by manipulating the 80386's page tables and page-table directory. Grouping of code and data into *objects* within an application at link time is controlled by the same old SEGMENT and GROUP directives. The Linker resolves all offsets to a common base by mandating the existence of a sort of super group—FLAT, which embraces all the memory objects in the application.

Next time we'll pick up this overview with the OS/2 2.0 API.

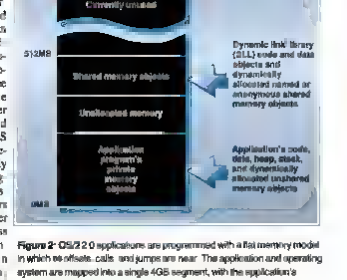

Figure 2: OS/2 2.0 applications are programmed with a flat memory model in which selectors, calls, and jumps are near. The application and operating system are mapped into a single 4GB segment, with the application's private code, data, and memory objects at the bottom of the address space and the operating system's private code and data at the top. Shared memory objects, such as DLL code and data, are mapped in between. Note that the application's private and shared address space is limited to 512M. This limit will be lifted in a future release of OS/2.

Explore the Depths And Impact of OS/2's New 32-bit API

OS/2 2.0, the new 80386-specific 32-bit version of OS/2, supports no less than three distinct Application Program Interfaces (APIs). One is the real-mode, DOS- and ROM BIOS–compatible API, which is reached via software interrupts by programs running in the DOS boxes. The second is the 16-bit protected-mode API, which is essentially identical to the API found in OS/2 1.2. Third, of course, is the 32-bit protected-mode API itself.

You might think of the new operating system as an immense package of functionality that wears one of three different wrappers, according to the type of application program that is running. OS/2 2.0 brings to mind Gordon Bell's characterization of many modern CPUs as "code museums," where the vestiges of many other CPUs whose era has passed can be seen in their instruction sets. In OS/2 2.0, we have the first instance of an operating system museum!

The 32-bit API deserves especially close examination, because it is more than the simple translation of the 16-bit API many of us had expected, and because it gives us some clues about Microsoft's and IBM's future plans.

At the most fundamental level, the 32-bit API employs a substantially different method of passing parameters than does the 16-bit API. Figures 1, 2, and 3 will help clarify the differences. The 16-bit API relies on a *far pascal* calling convention, in which parameters are pushed on the stack from left to right and the called routine is responsible for clearing the arguments from the stack. (OS/2 1.*x* inherited the use of this calling convention from *Microsoft Windows*, which originally adopted it solely because it saved a few hundred bytes of systemwide memory.) The 32-bit API uses a *cdecl* calling convention, in which parameters are pushed right to left and the caller clears the stack.

To be sure, the difference in parameter passing methods between the 16-bit and 32-bit APIs is the business of your compiler and linker; it is not ordinarily visible to the programmer. But it has a number of other, somewhat ominous implications. Conversion to *cdecl* makes the 32-bit API look very much like an extension of the C runtime library. This may be a happy situation for vendors of C compilers, but it is destined to cause increasing confusion and aggravation for everyone else in the programming tools business. Existing versions of Unix demonstrate the inevitable end point of this process all too clearly: in Unix you can't really tell where the C runtime library (RTL) ends and the operating system starts; porting a high-level language to Unix, which is not written in C, is sheer torture, and you often find the Unix kernel meddling in things that are properly the business of the runtime library (and vice versa).

> ■ Many of the changes in the 32-bit API kernel show a distinct shift toward C and away from assembly language programming.

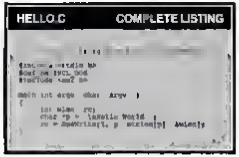

Figure 1: This simple "Hello World" program in C was used to generate the example API interface code in Figures 2 and 3.

At the level where the typical C application programmer works, the Presentation Manager and kernel portions of the 16-bit API have met with rather different fates during their conversion to 32-bit protected mode. The 32-bit Presentation Manager API is essentially identical to the 16-bit PM API. A program that calls only PM services and the C RTL requires only the most minor changes before it can be recompiled as a true 32-bit application. This fulfills the implicit promise of portability made by Microsoft's and IBM's PM header files, with all their multiple layers of macros, typedefs, and structures, and the horrendous toll they exact in compilation time.

The 32-bit kernel API is another story: many functions have been renamed while retaining essentially the same functionality; many new functions have appeared on the scene, and many old functions have disappeared for good. The intent of almost all of these changes is to rationalize the API and to make code more portable (eventually) to 32-bit versions of OS/2 that run on other processors.

The near-term impact of all these changes is distressing, however. In every version of OS/2 to date there have been significant shifts in the kernel API. Thus has meant that programmers who have called kernel functions directly from their programs in order to get the most out of the operating system have been forced to rethink and rewrite sizable chunks of their code—whether or not they used the Microsoft and IBM header files and abided strictly by Microsoft's and IBM's coding conventions and recommendations. OS/2 2.0 continues this ungracious tradition, rewarding even those programmers who have played by the rules with yet another major conversion effort.

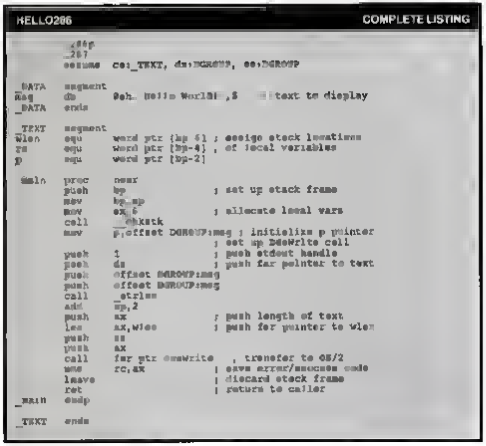

Figure 2: These machine instructions are generated by the 16-bit C compiler for a direct call to a kernel API function, from the source code in Figure 1. The code has been edited and commented for readability. The 16-bit API uses the far pascal calling convention, in which the parameters are pushed left to right and the called routine clears the stack. Notice that the compiler has optimized away certain memory references by "remembering" that the p variable contains the address of msg.

RENAMED API FUNCTIONS

For those 32-bit API functions that have been renamed but have remained functionally the same as their 16-bit counterparts, the renamings have generally aimed at rationalizing the API name space by putting all names into a more "predictable" form. For example, the 16-bit API contains a hodgepodge of names of the form DosGetxxx, *DosQxxx* and *DosQueryxxx*. In the 32-bit API, essentially all of the calls that obtain information from the operating system bit don't allocate some sort of resource have names of the form DosQueryxxx. Names have also been changed where necessary to put them into a "verb object" format symmetric with the PM API. For example, DosCWait became DosWaitChild, DosBufReset became DosResetBuffer, and DosFileLocks became DosSetFileLocks. The most important kernel renamings are summarized in Figure 4.

The extent of the renaming in OS/2 2.0 is actually more pervasive than I have made it appear. The entry points for all of the 32-bit API functions have been given names of the form Dos32xxx. This allows distinguishing between the 16-bit and 32-bit entry points for those functions that have otherwise identical names, so a 16-bit protected-mode program can selectively call 32-bit entry points and a 32-bit protected-mode program can call 16-bit entry points. When a 32-bit program is being compiled under more normal circumstances, however, all of these Dos32xxx names are aliased in the header files to the form Dosxxx. Thus the programmer need not be concerned with the existence of the Dos32xxx names at all.

VANISHED API FUNCTIONS

Almost all the kernel functions that have disappeared in the 32-bit API are those that had implicit or explicit machine dependencies. These range from calls like DosSetVec (an API equivalent of poking an 80x86 interrupt vector) to DosCLIAccess, DosPortAccess, DosCallBack, and DosR2StackRealloc (all of which were related to the 80x86 architecture's ring scheme of privilege levels) to DosGetInfoSeg (which returned selectors for two 16-bit protected mode segments). The information a program could previously extract from the global or local information segments must now be obtained by explicit calls to such functions as DosGetDateTime, DosQuerySysInfo, and the new function DosGetThreadInfo. The 16-bit Dosxxx functions that have gone away are listed in Figure 5.

In addition to these, the entire battery of Vioxxx, Kbdxxx, Mouxxx, and DosMonxxx calls is not supported by the 32-bit API. Although the 16-bit entry points for these calls are still available—and in fact, can be called by 32-bit programs—it is clearly Microsoft's and IBM's intention to divide 32-bit applications into two and only two categories: marginally interactive, character-oriented programs (such as the C compiler), which perform their input and output by DosRead and DosWrite of the standard device handles, and true Presentation Manager applications, which obtain their inputs through a window message queue and perform all their output by painting in a window. The ultimate objective here is no doubt a good one: to bludgeon all applications into using GUI, thus benefiting the end user. Still, it's a little sad to see the rather elegant VIO subsystem discarded completely (regardless of its close linkage to the design of PC video adapters). And now I can't understand why the AVIO functions were introduced in the first place.

In any event, the omission of the Vioxxx, *Mouxxx*, and Kbdxxx functions in the 32-bit API certainly sounds the death knell for assembly language programming under OS/2. The creation of PM applications in assembly language is clearly impractical, and there is little justification for writing character-oriented programs in MASM for performance reasons if control of the screen is limited to ANSI escape sequences.

NEW AND CHANGED API FUNCTIONS

The most drastic alterations in the API are in the areas of file management, thread management, memory allocation, semaphores, signals, and exception handling.

The "new" 32-bit file API is not really new at all. It will not cause any problems for those few programmers who have already converted their applications to handle the long filenames and extended attributes supported by OS/2 1.2, because the 32-bit DosOpen, DosFindFirst, and DosCreateDir of OS/2 2.0 are exactly symmetric to the DosOpen2, DosFindFirst2, and DosMkDir2 of OS/2 1.2. (See Power Programming, March 27, 1990, through May 15, 1990, for further information on these functions.) However, because of the rather narrow time window that existed for the OS/2 1.2 conversion (the retail OS/2 1.2 Programmer's Toolkit actually reached dealers *after* the OS/2 2.0 SDK started shipping), adapting to the 32-bit file API will still be a live issue for most software developers.

The 32-bit multitasking API is nominally the same as the 16-bit API with regard to control of sessions and processes, but the thread related functions have been significantly improved. Stack space for new threads is allocated automatically during DosCreateThread, and it is reclaimed automatically when the thread terminates. There is a new function, DosWaitThread, that allows one thread to wait for any other thread to die. This is analogous to the action of DosWaitChild (formerly DosCWait) for processes. However, the much needed DosKillThread API is *still* missing! Information on a per-thread basis is no longer obtained from the local information segment, which no longer exists for pure 32-bit applications; instead, a program must call the new DosGetThreadInfo function. This function returns a structure that contains (among other things) the current process ID, the current process's parent ID, the module handle, command-line pointer, environment pointer, current thread ID, current thread priority, thread stack size and base, and a pointer to the thread's exception handler chain.

The memory management API for OS/2 2.0 will take some study, but it is not difficult to master. Once you accept the transition from allocation of memory *segments* to allocation of memory *objects*, you will feel yourself back on familiar ground. The DosAllocSeg and DosAllocHuge functions have been merged into a single DosAllocMem function; DosFreeSeg has become DosFreeMem; DosGetSeg has become DosGetSharedMem; DosGiveSeg has become DosGiveSharedMem; and so on. The DosSubxxx functions are intact, and a new DosSubUnset function has been added. Programmers may even find these functions useful, now that they can be employed for managing local heaps!

There are, nevertheless, several important new concepts in OS/2 2.0 memory management. All memory allocations by the system are delivered rounded up to the next multiple of 4K (the 80386 page size). When you allocate a memory object, you also specify its access rights: execute, read-only, read-write, or guard (more about this in the next issue). Finally, a crucial distinction is drawn between memory object *allocation* and *commitment*. Allocation reserves a range of addresses for a memory object but does not in itself make those addresses accessable. Commitment reserves physical memory and/or swap file space for part or all of a memory object, causing the addresses within the committed pages to become valid.

One perhaps unexpected result of the allocation/commitment paradigm, along with the flat memory model for 32-bit applications, is that DosReallocSeg and DosReallocHuge have no equivalent in the 32-bit API. When you allocate an object, you are supposed to make it large enough for its worst-case requirements, then call DosSetMem to commit increasingly large portions of the object only when you need them. Alternatively, when data outgrows its memory object, you can allocate and commit a new, larger object, copy the data from the old to the new object, then release the original memory object. We'll be looking at OS/2 2.0 memory management in much more detail in forthcoming columns.

The 16-bit semaphore API has been completely replaced by a new, very complex 32-bit semaphore API. The latter supports three newly defined species of semaphores: mutex semaphores, event semaphores, and multiple wait semaphores. The new scheme eliminates some of the ambiguities, as well as the notorious limits on the number of system semaphores, of the 16-bit version of OS/2. In particular, there is no longer a distinction between *RAM Semaphores* (which cannot be cleaned up by the system) and *System Semaphores*; all semaphores are now under the control of the system, although the process can choose to make some semaphores "anonymous" so that other processes can't get access to them.

As you might expect, there are three symmetric sets of API functions (a total of about 20 different functions) that operate on the three new semaphore types: DosCreateEventSem, DosCreateMutexSem, DosCreateMuxWaitSem, and so on. The data structures for the semaphore types are not compatible in any way with the RAM semaphores, system semaphores, and Fast-Safe-RAM semaphores supported by the 16-bit API, so a 16-bit application and 32-bit application cannot communicate using semaphores unless they perform crossmode API calls. I'm sure the changes in the semaphore API are for the better, but I do wish that the semaphore API had ended up looking a bit more unified, compact, and straightforward. The code burden that OS/2 2.0 must carry around in order to support both the 16-bit semaphore API and the 32-bit API is enough to make you shudder.

While the changes in the semaphore API might make you apprehensive, however, most of the remaining interprocess communications functions are essentially untouched. The 32-bit API for anonymous pipes, named pipes, named shared segments, and queues is essentially identical to the 16-bit API (allowing, of course, for the substitution of 32-bit offsets for selector offset pairs and some renamings). However, *signals* as we knew them in OS/2 1.x have essentially disappeared. And rightly so: the signals in OS/2 1.x were only bizarre relics of Unix anyway! Instead, signal and exception handling have been regularized and unified, and the 16-bit signal (DosSetSigHandler, DosHoldSignal, DosSendSignal, DosFlagProcess) and exception handling (DosSetVec) functions have been entirely replaced by four new 32-bit functions: DosRaiseException, DosSetExceptionHandler, DosUnsetExceptionHandler, and DosUnwindException.

We'll discuss exception handling more thoroughly in a subsequent column, but there are two interesting points to touch on now. First, OS/2 2.0 contains a built-in floating-point emulator that automatically services "coprocessor not found" exceptions on a per-thread basis. Consequently, there is no longer a need for compilers to have separate software and hardware floating-point runtime libraries. All programs can be compiled with in-line coprocessor instructions, and if a program is executed on a machine without a floating-point coprocessor, the emulation library in the kernel will intercede and carry out the floating-point operations in a manner invisible to the application.

Second, 32-bit applications can register an exception handler for GP faults. This is a powerful feature that will make life a whole lot simpler for people like me, who write interpreters and incremental compilers—not to mention easing the jobs of developers of editors, spreadsheets, and others applications that are programmable in macro languages.

HELLO386 — COMPLETE LISTING

                end
```

Figure 3: These are the machine instructions generated by the 32-bit C compiler for a direct call to a kernel API function, again using the source code in Figure 1. The code has been edited and commented for readability. The reference to DosWrite in the source code has been automatically translated to the name of the actual 32-bit entry point, Dos32Write, by #define statements in the header files. Note that the 32-bit API uses the *cdecl* calling convention, in which parameters are pushed right to left and the caller clears the stack.

FUNCTIONS ELIMINATED IN OS/2 2.0

DosCalBack
DosCliAccess
DosFlagProcess
DosGetEnv
DosGetHugeShift
DosGetInfoSeg
DosGetMachineMode
DosGetPID
DosGetPPID
DosGetPrty

Power Programming

An Overview of the OS/2 2.0 Memory Management Scheme

The 80386-specific version of OS/2 differs in many ways from its 16-bit predecessors, but the most striking differences are found in the realm of memory management. Not a single OS/2 2.0 API function related to memory allocation or sharing has survived unchanged! Ironically, programmers who have had the most experience with OS/2—the pioneers who've been using it since Version 1.x—may find it harder to adapt to OS/2 2.0 than those who come to it from other CPU architectures or even from DOS. It's not easy to discard the painfully learned tricks and techniques that yield good performance in a segmented architecture—even when you know they can be harmful in the OS/2 2.0 environment.

In my next column, we'll consider OS/2 2.0's new memory management API and how it takes advantage of advanced features of the 80386. First, however, we must review the mechanisms for memory protection and addressing on the 80286 and 80386. I've discussed these topics previously in the contexts both of the eXtended Memory Specification (XMS) and of 80386 DOS Extenders. They must be examined again, but this time from the standpoint of a true protected-mode operating system and its client applications.

■ The task of combining compatibility with 80286 applications and with the older OS/2 1.x versions calls for a programming tour de force by OS/2 2.0.

80286 PROTECTED-MODE ADDRESSING

When the 80286 is running in protected mode, memory protection and virtual memory is supported in the hardware by a layer of indirection in memory-address generation. The value in a segment register is called a *selector* and, as shown in Figure 1, it consists of several bit fields. The upper 13 bits are an index into a descriptor table—a special data structure maintained by the operating system and interpreted by the hardware. The combination of selector and offset is called a virtual address.

The entries in a descriptor table are called, naturally, descriptors. Descriptors come in several types, with varying formats, but they are always 8 bytes long. An 80286 descriptor for an ordinary memory segment contains its base address, length, and access rights, together with several reserved fields. The layout is shown in Figure 2. The access-rights byte is particularly important because it defines, among other things, the way in which a segment may be used (executable, writable data, or read-only data), the privilege level needed to access the segment, and whether the segment represented by the selector is present in physical memory.

A selector, then, is like a file handle: it symbolizes data but its value has no direct correspondence to that data's location. Whenever an instruction references memory, a segment register is selected, either implicitly (by the instruction type) or explicitly (by a segment-register override). The CPU looks up the descriptor that corresponds to the selector in the segment register and uses the information in the descriptor to validate the memory access. If it finds no reason to bar the access, it forms a physical memory address by combining the base address from the descriptor with a 16-bit offset from the instruction and/or one or more registers, as depicted in Figure 3. If the access *is* to be disallowed, the CPU generates a memory-protection exception similar to a hardware interrupt.

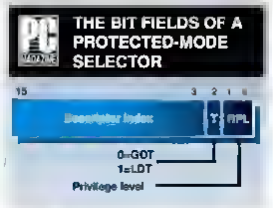

Figure 1: Selectors are like file handles: they represent data without giving its location. The hardware refers to a descriptor table to find the true memory address symbolized by a selector.

The essential linkage between the hardware and the software in this address-translation scheme is provided by a Global Descriptor Table (GDT). Before the CPU is switched into protected mode, a GDT must be constructed that contains (at a minimum) descriptors for a code segment and a data segment to be used by the current program. Further, the physical address and length of the GDT must be loaded into the Global Descriptor Table Register (GDTR). Normally, the initial GDT contains many other descriptors as well, including one that maps the GDT itself as a writable data segment. (This last permits the GDT to be modified after the switch to protected mode.)

Another descriptor table, called the Interrupt Descriptor Table (IDT), defines the virtual addresses of the system's protected-mode interrupt handlers. As with the GDT, the physical address and length of the IDT are loaded into the CPU's Interrupt Descriptor Table Register (IDTR) before the switch to protected mode. Again, in order for the IDT to be modifiable after the switch to protected mode, a descriptor that maps the IDT in a writable data segment must be present in the GDT.

The GDT and IDT are thus the crucial anchors for protected-mode execution. Other descriptor tables can exist in the system as well, but only one such additional table—called a Local Descriptor Table (LDT)—can be in use at any given time. Each LDT is a memory segment that is mapped by a special descriptor in the GDT. A particular LDT is activated by loading its GDT selector into the Local Descriptor Table Register (LDTR). Bit 2 of a selector determines whether its descriptor is in the GDT or in the current LDT.

PUTTING IT ALL TOGETHER

How can an operating system such as OS/2 make use of all these tables and structures to provide a fully protected, multitasking, virtual-memory environment for application programs?

First, and most important, the operating system reserves the manipulation of descriptor tables to itself. Since the operating system is in control throughout the boot process and at the time of the initial switch to protected mode, this is easy to arrange. The OS simply constructs the descriptors for the GDT and the Interrupt Descriptor Table (IDT)—as well as the descriptors for its own code and data in the GDT—so that they can be accessed only by code that is running at the highest privilege level. It then makes sure that it never allows any application to run at that privilege level.

Next, the operating system reserves the service of memory-protection exceptions to its own interrupt handlers. This is easy to arrange, because the IDTR is loaded during system initialization. The writable selector that corresponds to the IDT's memory is located in the GDT, so it, too, is controlled by the operating system. Consequently, an application program can't install an interrupt handler without the cooperation of the operating system. And again, in the case of the interrupt descriptors that correspond to the various memory-protection exceptions, the operating system chooses not to cooperate.

Finally, the operating system segregates one application from another by putting the descriptors for each program's code and data into a separate LDT and then enabling the proper LDT as part of a context switch. As a result, the memory that does not belong to an application is not *visible* to that application. If a program tries to use a selector for which it has an insufficient privilege level or one for which no corresponding descriptor exists, or if it uses an offset that is greater than the segment size specified in the descriptor's limit field, an exception called a *general protection* (GP) fault is generated. The operating system's handler then regains control and the application is terminated.

The typical 80286 protected-mode virtual-memory operating system distributes memory management among three modules. The lowest-level module is the *physical memory manager* (PMM). The PMM views RAM as a contiguous linear sequence of bytes with physical addresses from 000000h to FFFFFFh. The PMM divides the physical address space into chunks called arenas, which it allocates on demand. Each arena is preceded by an arena header indicating the arena's length and whether it is available or in use.

The next level is the *virtual memory manager* (VMM). The VMM creates memory segments on demand by calling the PMM to allocate an arena of an appropriate size, building a descriptor in the GDT or LDT, and returning a selector that can be used to address the segment. When physical memory becomes so fragmented that an allocation request cannot be met, the VMM works with the PMM to consolidate free arenas by moving existing segments around and updating the base addresses in their descriptors. If insufficient physical memory is available, then the third memory-management module, the *swapper*, comes into play.

The VMM first identifies a segment that has not been recently used. If the segment was a read-only data or an executable segment that can be reloaded from a program file, the VMM clears the *present* bit in the descriptor and calls the PMM to release the physical memory owned by the segment. If the segment contained modifiable data, the VMM calls the swapper to

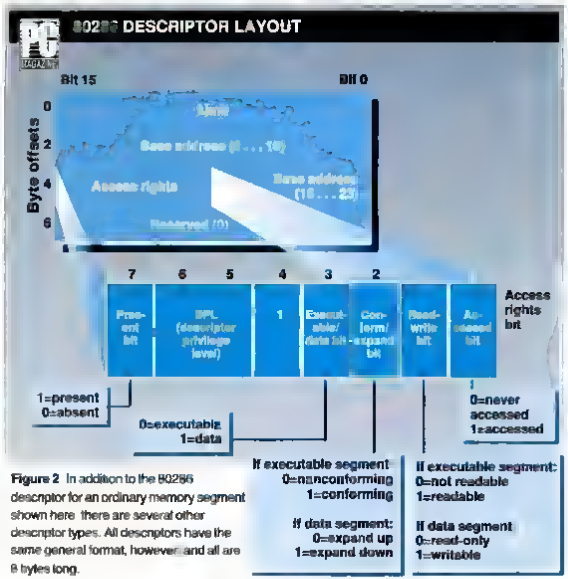

Figure 2: In addition to the 80286 descriptor for an ordinary memory segment shown here, there are several other descriptor types. All descriptors have the same general format, however, and all are 8 bytes long.

write the segment's contents to a swap file on-disk, clears the present bit, and then releases the physical memory. The process of discarding or swapping segments is repealed as many times as it takes to satisfy the new segment-allocation request.

What becomes of a swapped-out or discarded segment? The next time the selector for that segment is referenced by a program, the hardware finds the present bit in the descriptor cleared. It then generates a "segment not present" exception. This exception is fielded by the operating system, which passes control to the VMM. The VMM then allocates physical memory to hold the segment (possibly swapping or discarding one or more other segments to get the memory), calls the swapper to read the segment back in from disk, updates the descriptor with the new physical base address, sets the present bit in the descriptor, and finally executes an interrupt return to restart the instruction that caused the exception in the first place.

The VMM also has the responsibility of maintaining multiple descriptors, called *aliases*, that represent the same physical memory segment in different ways. For example, a segment that contains an application's machine code must be mapped in two ways. A descriptor with the executable attribute must exist for the segment so that the program has a valid CS selector. But another descriptor with the writable data attribute must exist so that the operating system can load the program's code into the segment from disk and do the necessary relocations. Alias tracking is one of the more-complex problems that must be solved in the implementation of a VMM, because the hardware provides no aid.

You've seen the physical structures that underlie the generation of memory addresses in protected mode, so you can understand why there are no software tricks to deliver us from the 80286's basic limitations. The 16-bit limit field of a descriptor corresponds to the 64K maximum segment size, and the descriptor's 24-bit base address limits the physical address space to 16MB. The virtual address space available to an application program is limited to 512MB, in two ways. First, the LDT is really a segment, so its maximum size is 64K—room enough for 8,192 8-byte descriptors. 8K * 64K (the maximum amount of memory mapped by one descriptor) is 512MB. Second, the descriptor index field in a selector is 13 bits wide, so descriptors can be numbered from 0 to 1FFFh (8,191)—leading again to the 512MB maximum.

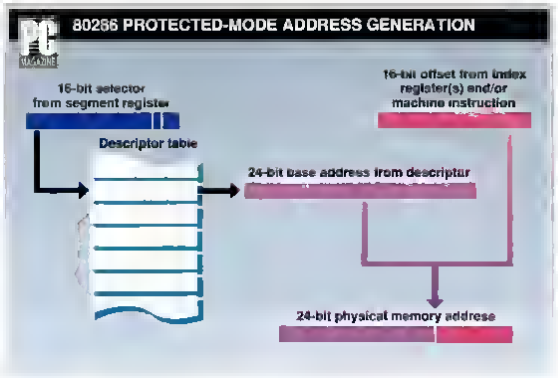

Figure 3: In 80286 16-bit protected mode, physical addresses are generated from a selector and offset. The upper 13 bits of the selector serve as an index into a descriptor table. The segmentation hardware combines the 24-bit base address from a descriptor with a 16-bit offset to form a 24-bit physical memory address.

80386 PROTECTED-MODE ADDRESSING

As shown in Figure 4, memory addressing in 80386 protected mode is a proper superset of the addressing mechanisms found on the 80286. Selectors and descriptors look much the same, except that the descriptor fields that were unused on the 80286 are brought into play so that the descriptor can accommodate a 32-bit base address and support segment sizes as large as 4GB.

But beneath the selector/descriptor mechanism, the 80386 introduces yet another, optional layer of address translation, called paging. The paging hardware sees physical memory as an array of 4K chunks, or *pages*. Once a linear, 32-bit address has been generated by combining the base address from a descriptor with a 32-bit offset, the 80386's paging unit can map this linear address onto a different physical address. It does this by treating the upper 20 bits of the linear address as a logical page number, translating the logical page number into a physical page number, and adding the lower 12 bits of the linear address onto the physical page's base address to get a 32-bit physical memory address. The procedure is shown in Figure 5.

The correspondence between logical pages and physical pages, and thus between linear addresses and physical addresses, is controlled by data structures called page tables and a page-table directory. Since they are built by the operating system and interpreted by the hardware, these structures are in a sense analogous to descriptor tables. On the other hand, the individual entries in page tables or directories bear little resemblance to descriptors. In fact, as you can see from Figure 6, there is hardly anything in a page-table entry that an 80286 programmer will find familiar.

The paging hardware provides support for memory protection and virtual memory that is totally independent of the support at the selector/descriptor level. The contents of the page tables and directory as a whole determine which linear addresses are valid in the context of the current process, while individual page-table entries determine whether a particular page is read-only or read-write, and whether it is accessible by a program running at the lowest privilege level or only by the operating system. Each page-table entry also contains present, accessed, and "dirty" bits. These bits indicate, respectively, whether the page's data is present in physical memory, whether the page was accessed since the last time the access bit was cleared, and whether the page was written to since the last time the dirty bit was cleared.

The crucial link between the hardware and the software for hardware paging is the CPU's Control Register 3 (CR3), which contains the physical memory address of the page-table directory. Paging is turned on when the operating system loads the CR3 register, then sets the PG (page enable) bit in Control Register 0 (CR0). Both of these control registers can be written only by a program running at the highest privilege level. Thus it is impossible for an application program to grab control of the paging system from the operating system.

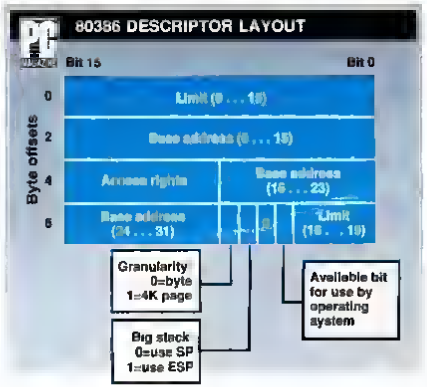

Figure 4: 80386 descriptors, such as the one shown here for an ordinary memory segment, follow the same general scheme as those for the 80286, except the reserved fields of the 80286 descriptors are used to allow segments as large as 4GB.

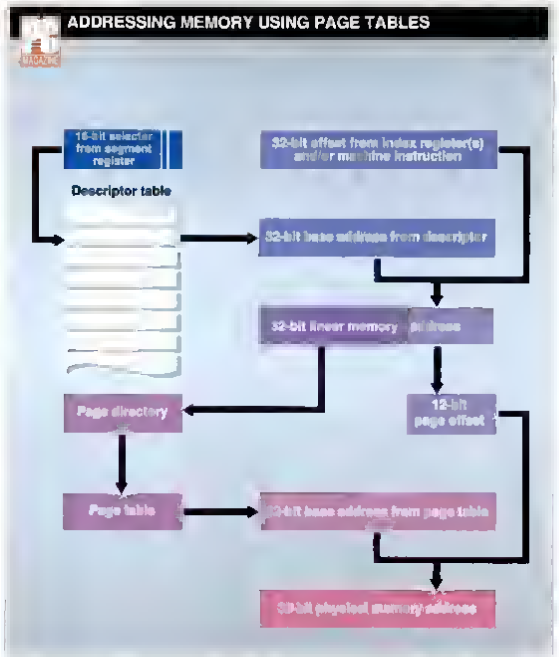

Figure 5: The 80386 uses two layers of address translation when paging is enabled. The selector and offset are translated to a 32-bit linear address, which is then translated by the paging unit into a 32-bit physical address.

IMPLICATIONS FOR AN 80386 OS

The two layers of memory protection and address mapping for the 80386 let an operating system designer choose from several different memory models: simple flat model, segmented model, paged flat model, and segmented paged model.

An operating system based on the simple flat model defines all memory as a single segment (which can be as large as 4GB). The paging hardware is disabled. The GDT can be very small, as it must contain only an executable descriptor and a writable data descriptor that map the same segment. A local descriptor table is unnecessary. Memory protection is essentially inoperative, because the segment registers are loaded at boot-time and never altered thereafter. All program code and data live in the same address space, all jumps and calls are near, and all variables can be reached with 32-bit offsets. The simple flat model is convenient in embedded systems in which all code can be trusted, but it's impractical for multitasking systems.

In the pure segmented model, the paging hardware is disabled and protection is provided only at the selector/descriptor level. An 80386 operating system based on this model would look much like OS/2 1.x except that segment sizes, instead of being restricted to 64K, could be as large as 4GB. But virtual memory management in the pure segmented 80386 model would be a beastly chore, which is why no operating system uses it. Imagine the delays that could be incurred if the VMM and PMM had to move 4GB segments to consolidate free physical memory. Or the problems that the swapper would encounter in trying

to swap segments that could range in size from 1 byte to 4GB!

The paged flat model is similar to the simple flat model except that the paging hardware is enabled. Again, the segment registers are loaded once with selectors that map all of the linear address space. Protecting the operating system code and data from application programs is implemented via the page tables. Segregation of one application's code and data from another's is also accomplished with the page tables; as part of a context switch, the operating system edits the page tables and page-table directory to make the previous application's physical pages invisible and the new application's physical pages visible in the linear address space.

The job of the operating system's VMM and swapper is very simple in a paged memory model. Physical memory is always allocated in 4K chunks, the swap file is always read or written in 4K chunks, and since the mapping of linear addresses onto physical addresses is completely controlled in the page tables, there is never a need to move things around in physical memory. The dirty bits in the page table entries, which are set when the corresponding page is written to, also allow the swapper to avoid many unnecessary disk writes. This is because if the swapper knows that a page has not been changed, and it knows where on the disk to get a fresh copy of the page when it needs it, it can reassign the physical page without rolling the page's contents out to disk first.

A segmented paged memory model for an 80386 operating system combines the advantages of the segmented and the paged models. Memory can be protected at two levels: descriptors and page tables. Memory can be allocated with a granularity of 1 byte, while swapping is carried out on the basis of a 4K page rather than on a segment basis. But the segmented paged model is expensive, both in terms of execution speed (because of segment register loads) and in terms of memory (to support both local descriptor tables and page tables). Worst of all, it still requires programmers to think about memory addressing in terms of 48-bit far pointers, which have a selector component that can't be arithmetically manipulated.

Which of these memory models does OS/2 2.0 use? From the point of view of a 32-bit application, OS/2 2.0 looks like a fairly pure implementation of the paged flat model. All of the application's code and data live in a single large segment, and all entry points to the operating system are available as near calls within the same segment. A 32-bit OS/2 2.0 application never needs to be aware of segments and never has occasion explicitly to load a segment register. (Segment registers *do* get loaded behind the scenes, however, whenever the application calls an API function that requires a switch in privilege levels.)

From the point of view of a 16-bit OS/2 1.*x* application or device driver running under OS/2 2.0, the environment looks as segmented as ever. OS/2 2.0 still provides 16-bit applications with an OS/2 1.*x*-compatible set of 16-bit API entry points that must be passed far pointers and are entered through far calls. The new operating system passes 80286-style far pointers to 16-bit device drivers regardless of whether the I/O request originated in a 16-bit or in a 32-bit application. OS/2 2.0 even supports a global information segment and local information segment that are compatible with OS/2 1.*x*, and it somehow contrives to keep them meaningful in a system designed for 32-bit applications.

The mind boggles at the contortions the OS/2 2.0 kernel must go through simultaneously to support multiple DOS applications in Virtual 86 Mode, multiple 16-bit protected-mode applications, and multiple 32-bit flat-model applications. The system can assume a different personality on each context switch. Moreover, it handles transformations between flat model (0:32) addresses and 80286-style selector-offset (16:16) pairs in a transparent manner, so 16-bit applications can call 32-bit APIs and 32-bit applications can call 16-bit APIs. Whenever I get a little impatient with the performance of the best release of OS/2 2.0, I have to pinch myself and remember how astounding it is that so complex a system can work at all.

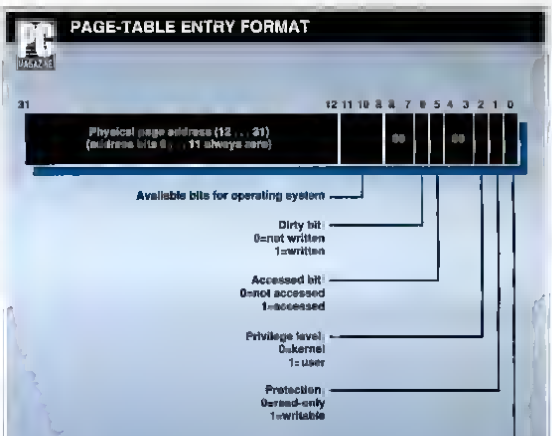

Figure 6 The individual fields of the page table and the page-table directory entry control the correspondence between logical and physical pages. These fields also provide support for memory protection and swapping in terms of 4K pages rather than segments.

Power Programming

Application Development Using OS/2 2.0's Memory Management

The addressing model and memory management techniques used by 32-bit programs under OS/2 2.0 represent a major leap forward on the path of software evolution for Intel 80x86 processors. They are also about as different from the models and techniques used in the previous versions of OS/2 as you could possibly imagine. Gone are the segments and selectors that were the indispensable currency of all memory transactions under OS/2 1.x. Instead, OS/2 2.0 relies almost completely on the 80386's paging unit to implement memory protection, memory sharing, and virtual memory.

In the last installment of this column, we looked at the basic mechanisms of memory address generation on the 80286 and 80386, at the architectural options available to designers of 80386 operating systems, and at the choices that were ultimately made in OS/2 2.0. In this issue, we'll examine memory management more closely from the point of view of a normal application program.

A flat memory model and 4 gigabytes have obvious advantages, but they can result in memory-protection and debugging difficulties too.

MEMORY MANAGEMENT BASICS

When you begin programming for OS/2 2.0 in its preferred 32-bit mode, you can forget about the small, medium, compact, large, and huge memory models that complicated life under DOS and OS/2 1.x. You can also forget about all the peculiar special pragmas, directives, and keywords for segmentation control that were commonly found in high-level-language compilers under those operating systems. A 32-bit application is much like an MS-DOS .COM program (which used the so-called tiny model, with CS=DS=ES=SS), except that the segment in which it lives is 4GB instead of 64K.

Within this 4GB segment, application code and data reside at the low end, and the operating system is mapped into the segment at the high end. Therefore, from the application's perspective, all jumps and calls are near, including operating system function calls. A 32-bit application never needs to be aware of segments at all and has no occasion ever to load a segment register explicitly. (Segment registers do get loaded behind the scenes whenever the application calls an operating system Application Program Interface (API) function that requires a switch in privilege levels, however.)

In OS/2 2.0, the application address space is limited to the first 512MB. This is further subdivided into three areas: the application's static code, data, and dynamically allocated private memory are at the bottom, dynamically allocated shared data and dynamic link (dynlink) library code and data (including the entry points for all operating system functions) are at the top, and unallocated memory is sandwiched in between. As additional private or shared memory is allocated (a 64MB minimum is enforced for each by the system), the two areas grow toward each other until free memory is used up, as diagrammed in Figure 1.

The first important thing to understand about memory management under OS/2 2.0 is that no matter what you might think you are allocating, releasing, or sharing, everything really happens in multiples of 4K—the standard page size for the 80386, 80486, and (presumably) 80586. The allocated chunk is referred to as a memory object, and the *handle* that is returned for an object is its 32-bit base offset. For example, if instead of using your high-level language's runtime library functions you call the operating system directly to allocate 200 bytes for an array, what you actually receive in return is the base offset of a 4K object. This fact has important implications both for system overhead and for debugging, as we shall see later.

The second crucial point to grasp is the distinction OS/2 2.0 draws between memory allocation and memory commitment. Allocation reserves a range of addresses in the 4GB linear address space, but it does not actually make those addresses valid and accessible. Commitment reserves physical memory and/or swap file space for part or all of a memory object on a page-by-page basis, thus causing the addresses within those pages to become valid. The first time a committed page is accessed, the system supplies a page full of zeros. You can commit an entire memory object at the same time you allocate it, but it is more reasonable to commit portions of the object only as they are needed, thus tempering the application's demand for system resources.

OS/2 2.0's facilities for memory protection are the third crucial issue with which you must become familiar. These are based on the capabilities of the 80386 paging unit. Each page can have one of these attributes: writable, read-only, or executable. On the 80386, executable is equivalent to read-only, and read-only or writable pages are in fact executable. But the distinction is preserved in the software interface because it may be supported in hardware on future processors. In addition, each page can potentially be marked as a guard page, such pages are useful in the management of dynamically growing data structures (such as stacks) because a special type of exception is generated when they are accessed.

To review, let's consider all the possible consequences of a reference to a specific linear address. If the linear address lies within a page that has never been allocated, then a general protection (GP) fault (interrupt 0Dh) will occur. If the page has been allocated but not committed or not marked as a guard page, then a page fault (interrupt 0Eh) occurs. Both of these internal interrupts are fielded by the operating system's interrupt handlers and are reported to the application's GP Exception handler, if one has been registered, if the application has not registered a GP Exception handler, it is terminated, much as it would have been under OS/2 1.x.

When an address within a guard page is referenced, a Guard Page Exception is generated. If the application has not registered its own handler for this exception, the action of the system's default handler is to commit the page and then mark the next lower page within the memory object as a guard page. Finally, when an address within an allocated, committed page is referenced, the type of access is checked by the hardware against the page's access rights: writable, read-only, or executable. If the access is valid, it proceeds normally; if the access is not valid, a GP Exception occurs.

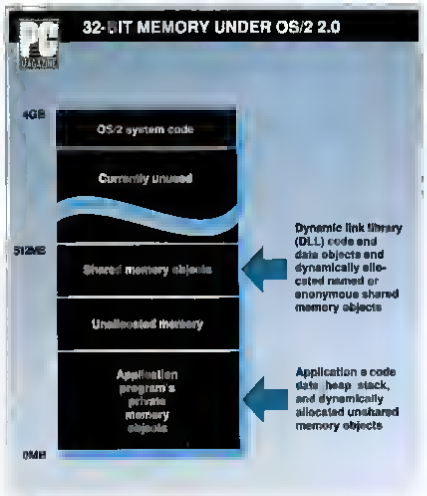

Figure 1: Under OS/2 2.0 a 32-bit application, dynlink libraries and operating system occupy a single segment with a 4GB linear address space. The application's portion of the address space is divided into three sections: application code, static data, and dynamically allocated private data at the low end; dynamic link library code and data and dynamically allocated shareable data at the high end, and free memory in between.

THE OS/2 2.0 MEMORY MANAGEMENT API

The memory management API functions available to 32-bit OS/2 2.0 applications are listed in Figure 2. They look fairly similar to the OS/2 1.x memory management API if you mentally substitute "memory object" for "memory segment." However, the similarities are actually more apparent than real. The somewhat different nature of memory protection, considerations of page commitment, and existence of guard pages guarantee that any OS/2 1.x memory management code you might already have on hand will not port to OS/2 2.0 without being completely rethought and rewritten.

A private memory object is allocated by a call to the 32-bit function DosAllocMem, which can be thought of as analogous to the 16-bit function DosAllocSeg. The pages within the object can all be committed at allocation time, or they can be selectively committed later by a call to the DosSetMem function. Access characteristics (read-only, read-write, executable, or guard) can also be specified at allocation time or on a page-by-page basis with DosSetMem, and a program can later retrieve commitment and access type information for a range of pages within an object with DosQueryMem.

A shared memory object is allocated with the 32-bit function DosAllocSharedMem, which is similar to the 16-bit function DosAllocShrSeg. As with DosAllocMem, the pages within a shared object can be committed and given access rights, either at the time of allocation or later, on a page-by-page basis, with DosSetMem. The shared object either can have a global

32-BIT MEMORY MANAGEMENT FUNCTIONS

Function name	Function action
DosAliasMem	Flag memory object as executable
DosAllocMem	Allocate private memory object
DosAllocSharedMem	Allocate shared memory object
DosFreeMem	Release memory object
DosGetNamedSharedMem	Get base address of named shared memory object
DosGetSharedMem	Make shared memory object addressable by the current process
DosGiveSharedMem	Make shared memory object addressable by another process
DosQueryMem	Get characteristics of memory object
DosSetMem	Set characteristics of memory object
DosSubAlloc	Allocate memory from local heap
DosSubFree	Free memory in local heap
DosSubSet	Create or reset size of local heap
DosSubUnset	Destroy local heap

Figure 2: In general, the 32-bit memory management functions available in OS/2 2.0 parallel those of Version 1.x, but differences in memory protection, page commitment, and the addition of guard pages will necessitate rewriting existing code.

name in the following form.

```
\\SHARENEM\objectname extension
```

or it can be allocated as an anonymous object by setting the function call parameter for the object's name to a NULL pointer.

A named shared memory object can be accessed by another process with the API function DosGetNamedSharedMem (analogous to the 16-bit function DosGetShrSeg), which establishes addressability for the object and returns the 32-bit offset of its base. An anonymous shared object must be declared as givable or gettable when it is allocated, so that it can later be made addressable for another process with the functions DosGetSharedMem and DosGiveSharedMem. These last are equivalent in their behavior to the 16-bit functions DosGetSeg or DosGiveSeg.

Both private and shared memory objects are deallocated as a unit by calling DosFreeMem, which is analogous to the 16-bit function DosFreeSeg. After an object is freed, the linear addresses within the pages previously occupied by that object are no longer valid, the characteristics and access rights of those pages (guard, read-only, and so on) are no longer relevant, and any reference to those addresses causes a GP Exception.

The 16-bit function DosAllocHuge has no counterpart in the 32-bit API, because it is not needed: the memory objects created by DosAllocMem or DosAllocSharedMem can (theoretically, at least) be of any size up to the application's entire linear address space. Likewise, the 16-bit functions DosGetHugeShift, DosSizeSeg, DosLockSeg, DosUnlockSeg, DosR2StackRealloc, and DosMemAvail find no home in the 32-bit API; they have also been made irrelevant by the transition from segment-based to page-based memory management.

The 16-bit functions DosReallocSeg and DosReallocHuge have no successors in the 32-bit API either, but here the reasons are more subtle. Since the handle for a memory object is a 32-bit offset, which is susceptible to arithmetic manipulations, and pointers to routines or data within the object also take the form of absolute 32-bit offsets, the system cannot move memory objects around with impunity in order to resize them.

This is one of the few glaring deficiencies in page-based memory management when compared with segment-based management; the operating system can relocate data in a segment anywhere in physical memory at any time, since the selector portion of the data's virtual address is not arithmetically related to the data's linear address.

In any event, there are two possible workarounds for the absence of 32-bit counterparts for the DosReallocSeg and DosReallocHuge functions. First, you can initially allocate a memory object that is large enough for its worst-case requirements without committing any of it at allocation time, then use an exception handler, guard pages, and the DosSetMem function to commit increasingly large portions of the object, as necessary. Alternatively, when data outgrows its memory object, you can allocate and commit a new, larger object, copy the data from the old object to the new object, and then release the original object.

Using the 80386's hardware paging unit for memory management has many advantages, especially in demand-paged virtual memory.

A PRACTICAL EXAMPLE

Figure 3 contains the source code for the program WC C (Word Count). WC is a 32-bit application that demonstrates the simplest aspects of OS/2 2.0 memory management; it makes direct calls to the kernel API functions rather than using the standard C runtime library memory functions.

The WC program is run from the command line with the name of an ASCII text file as a parameter:

```
wc filename.ext
```

WC determines the size of the file, allocates a memory object of the same size, and reads the entire file into the object. WC then scans through the file's data, counting characters, words, and sentences, and reports the results on the standard output device.

WC helps clarify some of the fundamental benefits of the 32-bit programming environment and flat memory model: the size of memory objects, file I/O operations, and the range of contiguous addresses are all limited only by the 32-bit size of a pointer or count argument and by the total of the system's physical memory plus available space on the swap device. In effect, WC exploits the system's swap file as a linearly addressable work area. This avoids the need either to read the file in blocks and double-buffer the data or to use the C runtime library's much slower stream functions.

To build WC.EXE, use the command

```
CL386 WC.C
```

Naturally, in order to compile and link WC.C, you will need the OS/2 2.0 Software Development Kit (SDK), which includes the Microsoft 80386 32-bit C compiler (CL386), the Microsoft Linear Application Linker (LINK386), and the OS/2 2.0 32-bit API import library (OS2-386.LIB).

FLAT-MODEL TRADE-OFFS

With the material in this and in my preceding column securely under your belt, you can begin to discern some of the trade-offs inherent in OS/2 2.0's abandoning segmentation as a memory management tool. Using the 80386's hardware paging unit for memory management has many advantages, especially in the area of demand-paged virtual memory. However, there are also several capabilities—particularly those related to memory protection—that are lost forever because they are inherently associated with the segmentation paradigm. We've already discussed one of these (the inability to freely relocate memory objects in physical memory), however, there are also several other lost capabilities that I feel obliged to mention.

The most striking loss, at least from a debugging point of view, is the change from 1 byte to 4K granularity in memory allocations. In OS/2 1.*x*, you could get quite a bit of debugging assistance *for free* by putting arrays and other data structures into individual segments. If your program accidentally indexed outside the array or structure, the segmentation hardware would immediately trap the reference and (if you were running your program under CodeView) the cursor would be put right on the source code line that produced the error. In OS/2 2.0, an array index out of bounds isn't going to be noticed by the hardware until (at best) it walks off the end of the last 4K page of the memory object that holds the array or structure. It may not be noticed even then if the memory object happens to be contiguous with another object.

The mapping of the entire application memory space by the CS selector and the inability of the paging hardware to distinguish between executable code and read-only data lead to yet another class of debugging problems. OS/2 1.*x*, which relied on the segmentation hardware, was able to segregate executable code from data in a very strict manner. If you tried to write to a code segment or execute a data segment, you would get an instantaneous GP fault. In OS/2 2.0, on the other hand, code and data are intermixed, and it is quite easy (inadvertently or otherwise) to create self-modifying code or to take a branch into a data area. In the latter case, you'll undoubtedly get an "invalid opcode" fault eventually, however, it's possible that some damage could be done before the fault is generated.

The last drawback to paged memory management is its increased system overhead. OS/2 1.*x* imposed approximately 100 bytes worth of hidden system overhead per segment, about half of which was swappable. This overhead consisted of the segment's descriptor, the tables used by the operating system to track segment ownership and segment aliases, the arena header used by the physical memory manager, and so on. In OS/2 2.0 there is also a hidden system overhead on the order of 100 bytes per memory object, which consists of page table entries, system structures to track page ownership and sharing, and so on. In addition, however, there is an unavoidable system memory overhead that results directly from the 4K granularity of allocations: on average, 2K of physical memory or swap file space is wasted per memory object.

Applications that allocate many small data objects or that are built up from many small logical code segments using compiler pragmas are likely to impose an inordinately heavy drain on system resources under OS/2 2.0. If you have an OS/2 1.*x* program that called the DosAllocSeg function for everything, you should probably redesign it to use the suballocation functions (DosSubSet, DosSubAlloc, and so on) in OS/2 2.0. In addition, if you really feel the need to control code locality and grouping directly, you should use the pragmas carefully to try and make the size of each code object slightly less than some multiple of 4K.

            case ' ' :             // period found, count
            case '.' :             // exclamation mark, implicitly
            case '!' :             // assumption for words
            case '?' :             // sentences (simplistic
                fsentences++;      // assumption for EOS)
                break;

            case LF:               // line feed found, count
                flines++;          // lines, fall through

            case CR:               // if first whitespace
            case BLANK:            // character following
            case EOFM:             // text, count words
            case TAB:
            case EOS:
                if(wflag) fwords++;
                wflag = FALSE;
                break;

            default:               // if not whitespace
                wflag = TRUE;      // character, assume we
                break;             // are traversing a word
        }
    }

    if(wflag) fwords++;            // in case word at end

    DosFreeMem(fbuffer);           // release file buffer

    printf("\n%d characters, %d words, %d lines, %d sentences.\n",
        fstatus.cbFile, fwords, flines, fsentences);
}
```

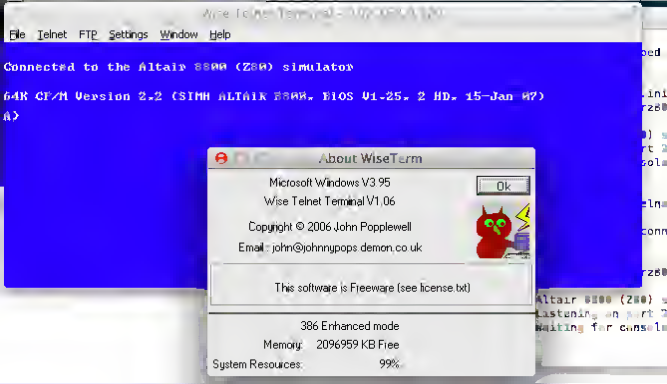

Figure 3 WC C is the source code for a practical example of a 32-bit OS/2 2.0 application that uses direct calls to the 32-bit memory management API. The program counts characters, words, lines, and sentences in ASCII text files.

Select the MSMQ client or server to install:
Primary Enterprise Controller (PEC)
Primary Site Controller (PSC)
Backup Site Controller (BSC)
Routing Server
Independent Client
Dependent Client
RAS Connectivity Service
MSMQ Type Description:
One Primary Enterprise Controller (PEC) must be installed on your enterprise network. The PEC contains the master copy of the MSMQ Information Store.
The PEC functions as a Primary Site Controller (PSC) for one site.
MS SQL Server 6.5 is required to install a PEC.
One Primary Enterprise Controller (PEC) must be installed and available on an enterprise network for any other MSMQ server or client to be installed.

Indianhomestays.org is an independent travel company, specializing in Home stays, Bed and Breakfast, Resorts and Service Apartments. We are a small, friendly group of travel professionals, who aim to arrange reliable, safe and secure Home-stays, Bed and Breakfast, Resorts and Small hotels across major cities of India. Most of our homestays do not boast of luxury, however, they are charming places with all basic comforts & amenities, cleanliness, hygiene, delicious home-made simple food and courteous service. We are proud to mention that we have a very high client satisfaction rating

Hack 1.0 preliminary version — last edit Mon Dec 17 1984

Level 1 Gold 281 Hp 12(12) Ac 10 Str 11 Exp 1/0

Hello from UNIX v7

C:\WINDOWS\system32\CMD.EXE - apout \usr\games\wump
The list is terminated with a 0.
The first room in the path must be connected to the
room you are in. Each succeeding room must be
connected to the previous room.
If there is no tunnel between two of the rooms
in the arrow's path, the arrow chooses one of the
three tunnels from the room it's in and goes its
own way.
If the arrow hits the wumpus, you win!
If the arrow hits you, you lose!
Warnings:
When you are one or two rooms away from the wumpus,
the computer says:
'I smell a Wumpus'
When you are one room away from some other hazard, it says:
Bat 'Bats nearby'
Pit - 'I feel a draft'
You are in room 19
I feel a draft
There are tunnels to 7 12 14
Move or shoot (m s)

Welcome to Dungeon!
Dungeon is a game of adventure, danger, and low cunning. In it
you will explore some of the most amazing territory ever seen by mortal
man. Hardened adventurers have run screaming from the terrors contained
within.
In Dungeon, the intrepid explorer delves into the forgotten secrets
of a lost labyrinth deep in the bowels of the earth, searching for
vast treasures long hidden from prying eyes, treasures guarded by
fearsome monsters and diabolical traps!
Dungeon was created at the Programming Technology Division of the MIT
Laboratory for Computer Science by Tim Anderson, Marc Blank, Bruce
Daniels, and Dave Lebling. It was inspired by the Adventure game of
Crowther and Woods, and the Dungeons and Dragons game of Gygax
and Arneson. The original version was written in MDL (alias MUDDLE).
The current version was translated from MDL into FORTRAN IV by
a somewhat paranoid DEC engineer who prefers to remain anonymous.
On-line information may be obtained with the commands HELP and INFO.

Release 37 / Serial number 851003
Another routine day of drudgery aboard the Stellar Patrol Ship Feinstein. This morning's assignment for a certain lowly Ensign Seventh Class: scrubbing the filthy metal deck at the port end of Level Nine. With your Patrol-issue self-contained multi-purpose all-weather scrub brush you shine the floor with a diligence born of the knowledge that at any moment dreaded Ensign First Class Blather, the bane of your shipboard existence, could appear.
Deck Nine
This is a featureless corridor similar to every other corridor on the ship. It curves away to starboard, and a gangway leads up. To port is the entrance to one of the ship's primary escape pods. The pod bulkhead is closed.
Deck Nine Score: 0/4451

The World's Best Selling UNIX Clone Just Got Better.

Now with full 32-bit implementation!

If you want to ignite your 32-bit hardware with the multi-user, multi-tasking power of UNIX, Coherent 4.0 has arrived. And if you're operating or selling small business network systems with dozens of users, that's really good news. Because Coherent 4.0 is what you want in UNIX at a price that's hard to believe.

Run UNIX applications today!

Coherent is now binary compatible with UNIX. Most UNIX PC applications port with a simple recompile and many now run right out of the box. The list is growing everyday, so call for details.

Yes, It's For Real!

How can it be? First of all, Coherent was independently developed by the Mark Williams Company, so you don't pay for UNIX licensing fees. You don't pay any mark-up or reseller costs either. Coherent is only sold directly to you.

> "...(Coherent) may be the best thing that has happened to UNIX yet."
> –Williams Zachmann PC Week

In fact over 40,000 copies of Coherent have already been sold. And, like the ones we quote here, virtually every critic who's reviewed Coherent has raved about it.

So Much Less, Yet So Much More.

As a virtual clone of UNIX, Coherent embraces the original UNIX philosophy: Small is beautiful. Small price, yes. But there's more, much more, to Coherent than its amazing price.

Requiring only 10 megabytes of disk space, Coherent can reside with DOS. So you can keep all your DOS applications and move up to Coherent. And it runs with as little as 1 MB of memory versus 4 MB for other UNIX versions.

The World's Only Plug And Play UNIX Clone.

You'll have Coherent up and running with a fraction of the time and effort it takes for other UNIX versions. Our six disk installation is a breeze compared to their 25. You'll also learn it faster and increase overall performance. All because Coherent is smaller, faster ... and better.

Small, But So Complete.

Make no mistake. Coherent is a wholly professional development system. You get a complete

> "Coherent comes as fully qualified as a UNIX clone you find yourself thinking, I can't believe it's not UNIX!"–Sean Fulton, UNIX Today!

C compiler, assembler and over 200 UNIX commands including full sets of functions for development, administration, maintenance and text processing.

Coherent also comes with UUCP capabilities that connect you to a world-wide network of free software, news and millions of UNIX users. And it's all clearly documented in Coherent's highly praised 1200 page manual.

Coherent. Still $99.95.™

	MWC COHERENT Version 4.0	SCO UNIX/386 Version 3.2V2
No. of Manuals	1	14

Experienced, Supported, Guaranteed.

Mark Williams Company has been developing professional programming tools since 1976. Our commitment to our products and users is unsurpassed. Users applaud our popular BBS and the widely acclaimed telephone support they get free from Coherent developers.

Still, we're not asking you to take a chance on Coherent. We've made it foolproof to see for yourself–with a 60-day money-back, no hassles guarantee. So pick up that phone and order Coherent now. And the best way to UNIX will be on its way to you!

Bringing back the WinZork demo via jsDOSBox

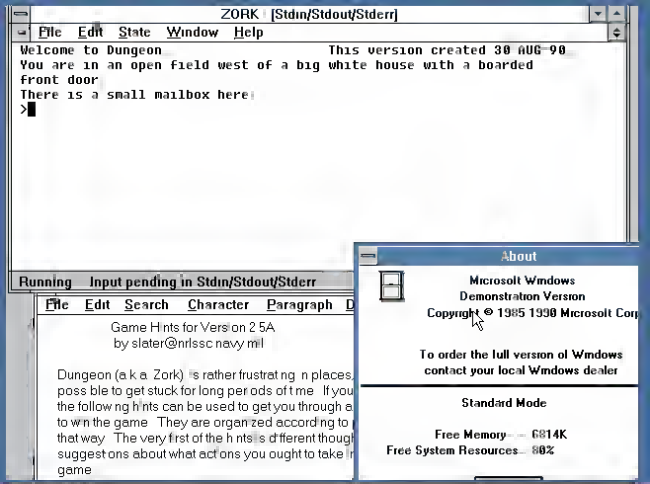

4

Posted on January 26, 2015 by neozeed

So with all the excitement with jsDOSBox it was about time I tried to get something from my old java dosbox stuff running again

As a quick note as of right now you cannot boot into a disk image Nor can you really run bat files or any kind of drivers beforehand It's basically either use a script that adds files one by one or use an image file which gets mounted and you run your exe/com file from that.

So here we go back again is the old Fortran Dungeon (zork) compiled with QuickC for

ZORK [Stdin/Stdout/Stderr]
File Edit State Window Help
Welcome to Dungeon This version created 30 AUG 90
You are in an open field west of a big white house with a boarded
front door

What's MacMiNT?
Supported Hardware and OS
Where is it?
How to Install?
Usage
Other Tools
Future Plan
What's MacMiNT?
MacMiNT is a Mac OS version of multitasking OS named MiNT which was originally written for Atari ST You can run a lot of UNIX programs like tcsh, gcc, emacs, diff, patch, rcs, etc You can also compile and run many free software for UNIX Though the original MiNT has TCP/IP and X Window System MacMiNT doesn't support them
Supported Hardware and OS
I have tested on
PowerBook 165c (68030 33MHz) Mac OS 7.6, VM off
PowerBook 3400c/240 Mac OS 8.5.1 (J), VM on
I've heard that it worked on
iBook
PowerBook G3
PowerMac G4
Mac OS 9
etc
I believe it will not work on Mac OS X (Server), where you have no need
Where is it?
Here it is!

Download Windows 10

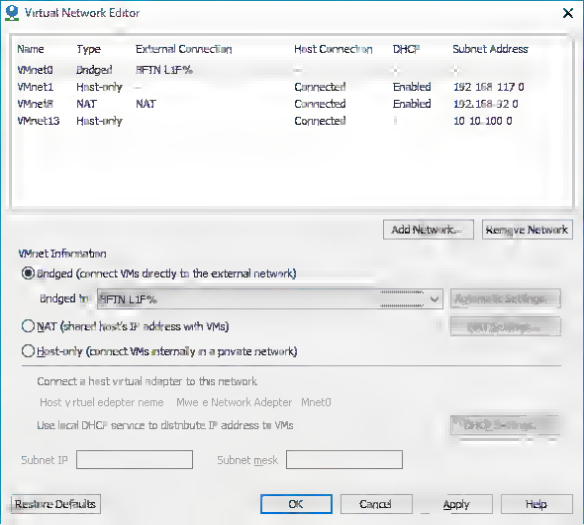

If you need to install or reinstall Windows 10, you can use the tools on this page to create your own installation media using either a USB flash drive or a DVD

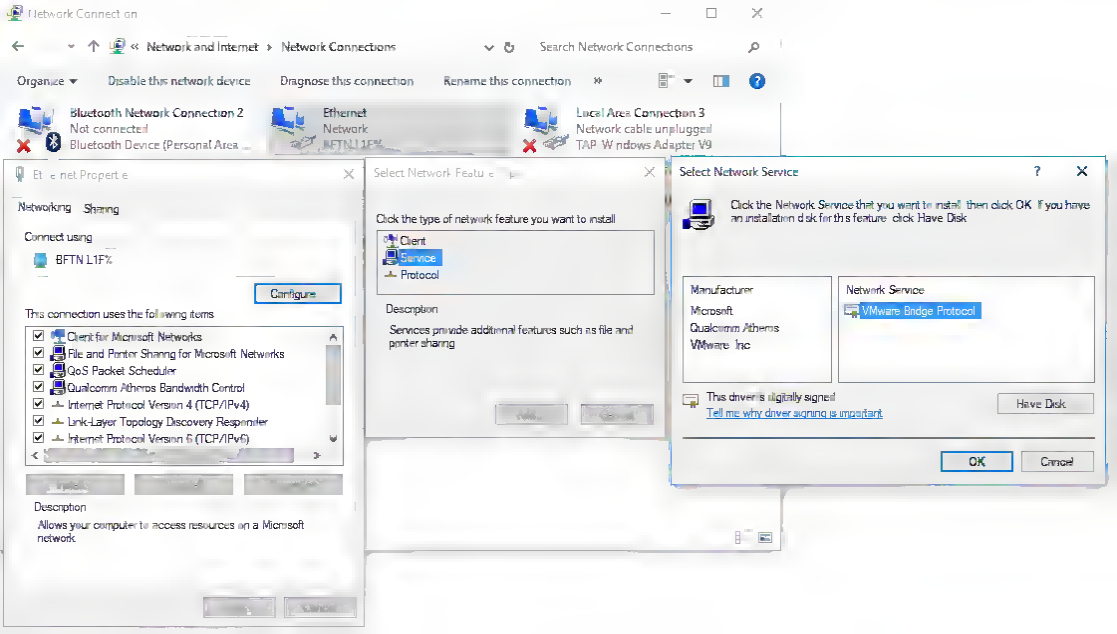

Before you begin

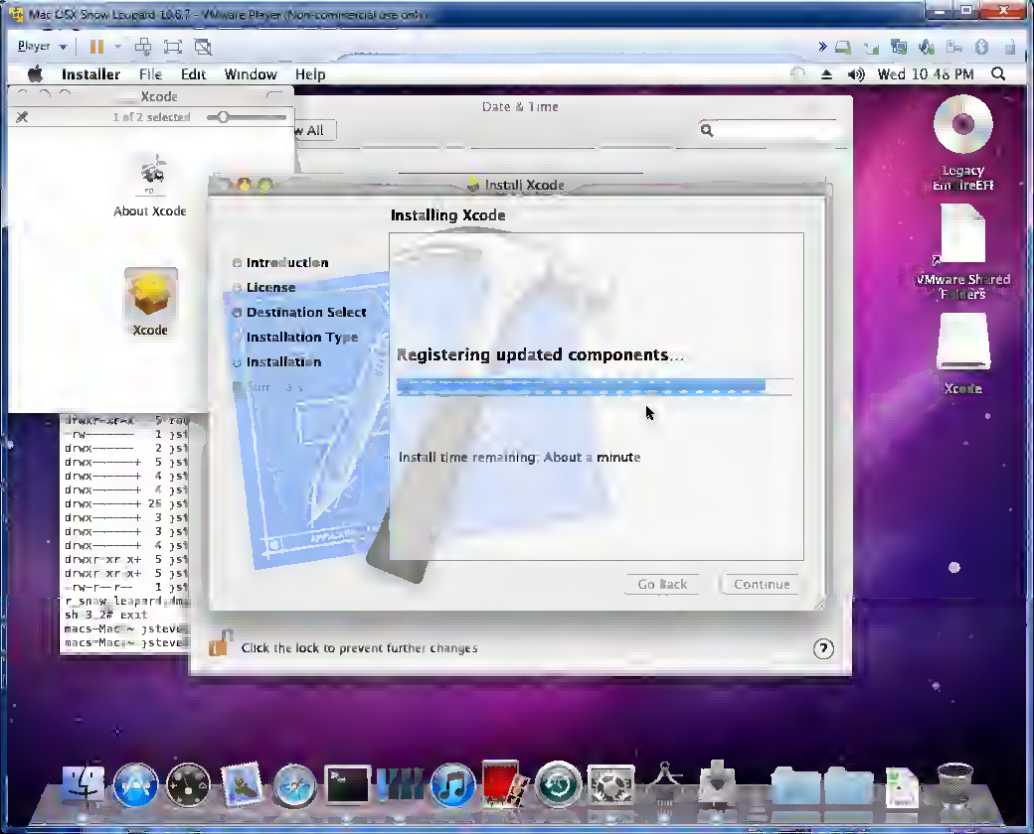

- Make sure you have
  - An internet connection (internet service provider fees may apply)
  - Sufficient data storage available on a computer, USB or external drive for the download
  - A blank USB or DVD (and DVD burner) with at least 4 GB of space if you want to create media. We recommend using a blank USB or blank DVD, because any content on it will be deleted
- Read the System Requirements
- If you will be installing the operating system for the first time, you will need your Windows product key (xxxxx-xxxxx-xxxxx-xxxxx-xxxxx). For more information about product keys and when they are required, visit the FAQ page
- For Enterprise editions, please visit the Volume Licensing Service Center

Use the media creation tool to download Windows. This tool provides the best download experience for customers running Windows 7, 8.1, and 10. To learn how to use the tool, go to the Installing Windows 10 using the media creation tool page. Tool includes

- File formats optimized for download speed
- Built-in media creation options for USBs and DVDs
- Optional conversion to ISO file format

Snapshot/backup
Create a snapshot (or keep a backup of downloaded archive) before first booting and working with this VM so that you can reset quickly after the OS trial expires.
Licensing notes and evaluation period
The modern.ie virtual machines use evaluation versions of Microsoft Windows, and are therefore time limited. You can find a link to the full license on the desktop.
Activation
For Windows 7, 8, and 8.1 virtual machines, you need to connect to the Internet in order to activate the trial. In most cases, activation will be done automatically after a few minutes, but you can also enter "slmgr /ato" from an administrative command prompt. This will give you 90 days.
For Windows Vista, you have 30 days after first boot.
For Windows XP, you have 30 days after first boot. You will see a toast notification pop up a few minutes after boot stating the days left (in the system tray).
Re-arm
In some cases (Windows XP, Vista, and 7), it may be possible to further extend the trial period if there are rearms left. The following commands can be run from an administrative command prompt (right-click Command Prompt and select "Run as administrator").
Show current license, time remaining, re-arm count (all except Windows XP):
slmgr /dlv
Re-arm (all except Windows XP). Requires reboot.
slmgr /rearm
Re-arm (Windows XP only). Note that no error is given in the case no rearms are left.
rundll32.exe syssetup,SetupOobeBnk
For Windows 8 and 8.1, you will NOT be able to re-arm the trial.
There are unused icons on your desktop
The desktop cleanup wizard can help you clean up your desktop. Click this balloon to start the wizard.

Subject: Weekly Mini-FAQ post for DJGPP
This is posted weekly to the djgpp news group and mailing list
What is DJGPP? DJGPP is a 32 bit C/C++/Obj-C++/Ada/F95 development suite for the MS-DOS environment, based on the GNU tools
Full information is found in the complete (200+ page) FAQ
make sure you get the complete FAQ (see below)
How do I get DJGPP?
FTP ftp://ftp.delorie.com/pub/djgpp/current/
WWW http://www.delorie.com/pub/djgpp/current/
RSYNC rsync.delorie.com::djgpp/current/
(see http://www.delorie.com/djgpp/getting.html for a complete list)
USMAIL Contact dj@delorie.com for information

XFER/AT     Version 2 1

Do you wish to prepare the winchester hard disk
for VENIX/86 operation? (y or n) Yes
_
```

VENIX/86 Installation Procedure

Part I (Disk Partitions)

Are the default winchester partitions acceptable? (y or n) yes
Partition sizes
        System = 2980 blocks
        Swap = 750 blocks
        Temp = 340 blocks
        User = 37672 blocks

VENIX/86 Installation Procedure
Part II (User Area)
Do you wish to create the user area? (y or n) Yes
Do you wish to check for bad blocks on the user area? (y or n) No
Creating a file system on the user area.
mkfs /dev/w0 usr 37672
Isize = 324
Tar the user area to the winchester from the floppy
tar xf8 /dev/rf0
Remove the XFER floppy and insert USER 1 floppy in drive A
Press 'return' to begin the tar extract to the winchester

```
Do you wish to check for bad blocks on the user area? (y or n) No

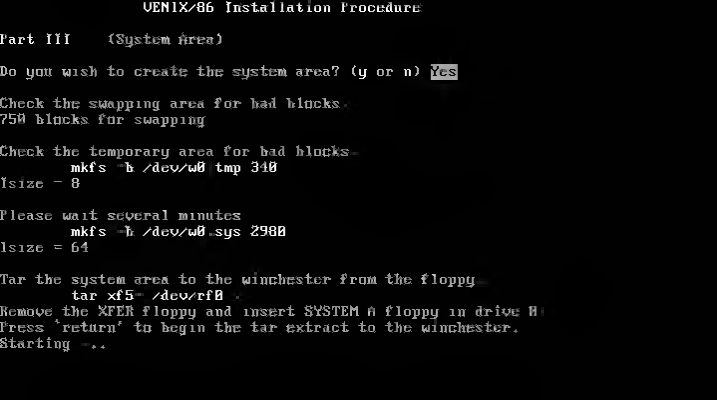

Creating a file system on the user area.
        mkfs /dev/w0 usr 37672
Isize = 324

Tar the user area to the winchester from the floppy
        tar xf8 /dev/rf0
Remove the XFER floppy and insert USER 1 floppy in drive 0.
Press 'return' to begin the tar extract to the winchester
Starting
SOFT ERROR in reading this floppy
Would you like to

        Abort the transfer,
        Retry reading the floppy, or
        Ignore the error

Type 'a', 'r', or 'i'? Abort
Remove the USER floppy and reinsert the XFER floppy in drive 0.
Press 'return' when ready Unknown interrupt (ignored)
Unknown interrupt (ignored)

User area completed
```

VENIX/86 Installation Procedure
Part III (System Area)
Do you wish to create the system area? (y or n) Yes
Check the swapping area for bad blocks.
750 blocks for swapping
Check the temporary area for bad blocks.
mkfs -b /dev/w0 tmp 340
Isize = 8
Please wait several minutes
mkfs -b /dev/w0 sys 2980
Isize = 64
Tar the system area to the winchester from the floppy.
tar xf5 /dev/rf0 .
Remove the XFER floppy and insert SYSTEM A floppy in drive A
Press 'return' to begin the tar extract to the winchester.
Starting ...

```
Please wait several minutes.
        mkfs -t /dev/w0 sys 2980
lsize = 64

Tar the system area to the winchester from the floppy
        tar xf5- /dev/rf0
Remove the XFER floppy and insert SYSTEM A floppy in drive A.
Press 'return' to begin the tar extract to the winchester.
Starting

How satisfied were you with the experience of upgrading to Windows 10?

(•) 1 ( ) 2 ( ) 3 ( ) 4 ( ) 5

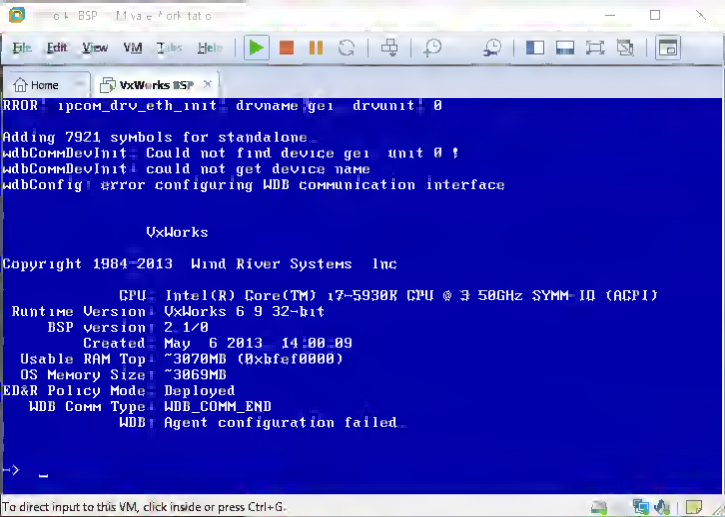

Not satisfied enough — Very satisfied

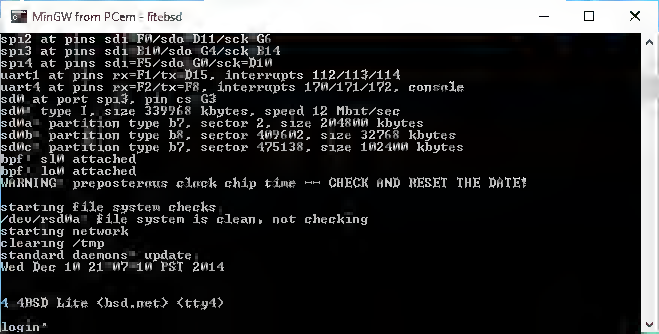

What can we do to make it better?

Needing to convert a dynamic disk to a MBR disk to satisfy the terse error "0xc1900101 – 0x20004 The installation failed in the SAFE_OS phase with an error during the INSTALL_RECOVERY_ENVIRONMENT" is something that could have been easily checked ahead of time

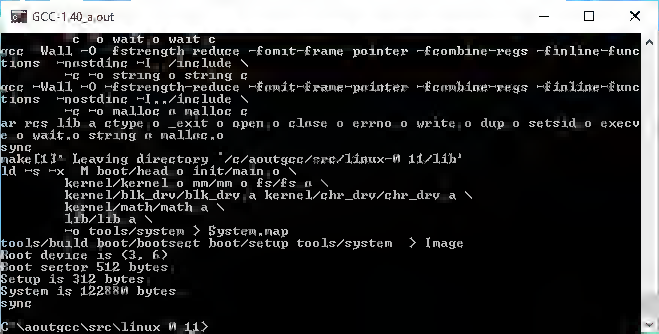

By g ving us feedback, you agree that M crosoft may use your feedback to improve our products and services

ゲームを始める

①メインメニュー画面の時に、カートリッジアダプターのスロットにゲームカートリッジを接続します。

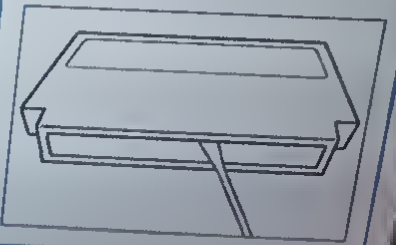

②ゲームの読み込みが完了したら、[ゲームを始める]にカーソルを合わせて決定します。

●各スロットの対応カートリッジ
FCスロット　:ファミリーコンピューター用
SFCスロット :スーパーファミコン用、
Super Nintendo Entertainment System用
MDスロット　:メガドライブ用、GENESIS用
GBスロット　:ゲームボーイ用、ゲームボーイカラー用、
ゲームボーイアドバンス用
PCEスロット :PCエンジン用、TurboGrafx-16用、
PCエンジン スーパーグラフィックス用

[カートリッジが認識されない時]
カートリッジを接続してもゲームタイトルが[UnknownGame]と表示されたり、エラーが表示される場合は、カートリッジの端子を乾いた綿棒などを使ってクリーニングしてください。

各部の名称

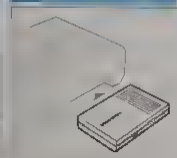

カートリッジアダプター

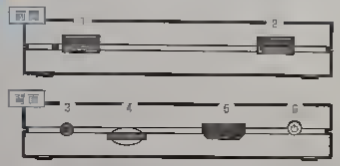

＊対応機種一覧は側面をご覧ください

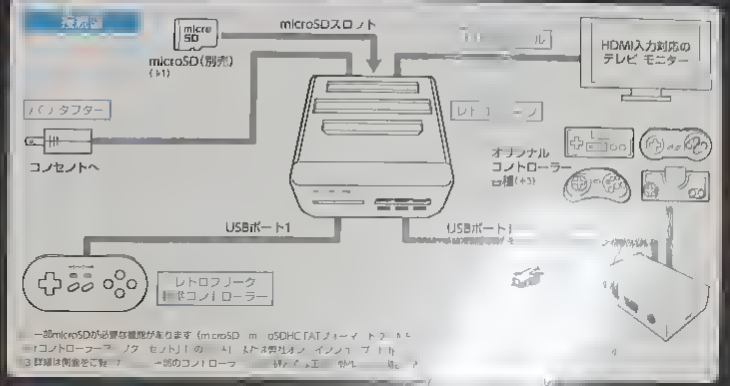

レトロフリーク本体

＊初期状態ではカートリッジアダプターに接続されています

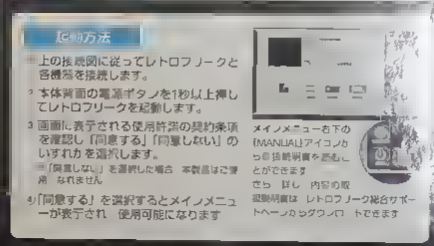

①USBポート1
②USBポート2
③ACアダプター端子
④microSDスロット
＊microSD／microSDHC
FAT 256MB～32GBに対応
⑤HDMI出力端子
⑥電源ボタン

＊2 microSDが必要な機能があります（microSD、microSDHC「FATフォーマット」）

＊3 詳細は側面をご覧ください

使い方

1 上の接続図に従ってレトロフリークと各機器を接続します。

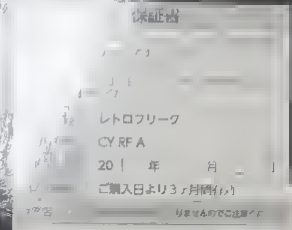

2 本体背面の電源ボタンを1秒以上押してレトロフリークを起動します。

3 画面に表示される使用許諾の契約条項を確認し「同意する」「同意しない」のいずれかを選択します。
「同意しない」を選択した場合、本製品はご使用になれません。

4 「同意する」を選択するとメインメニューが表示され、使用可能になります。

メインメニュー右下の「MANUAL」アイコンから各種説明書を読むことができます。
さらに詳しい内容の取扱説明書は、レトロフリーク総合サポートページからダウンロードできます。

Steam is now priced in Hong Kong Dollar.

The entire Steam catalog is now priced in Hong Kong Dollar for customers living in Hong Kong.

Frequently Asked Questions

What happened to USD in my Steam Wallet?

Hong Kong accounts with Steam Wallets in USD have automatically been converted to Hong Kong Dollar, at a conversion rate dictated by market value at the time of conversion. To view your wallet balance and account details, go to https://store.steampowered.com/account.

Can I continue to make purchases in USD?

The Hong Kong Dollar is the currency that is available for purchases made in Hong Kong.

Has the availability of games on Steam changed with this?

No changes have been made to the contents of your library. All of the languages and features in the games that existed when the store was priced in USD are still available. Most games previously available in USD are now priced in HKD and are available for purchase in Hong Kong, but an occasional product may be missing until it is priced in HKD.

USL suit raises Berkeley Unix hackles

BY MARYFRAN JOHNSON
CW STAFF

The touchy legal topic of intellectual property rights is at the heart of a David-and-Goliath-style conflict that is pitting Unix System Laboratories, Inc (USL) against a fledgling software firm and the academic Unix community.

At issue are the kind of copyright and licensing protections that corporate users are increasingly attentive to, but that Unix followers have seldom had to worry about.

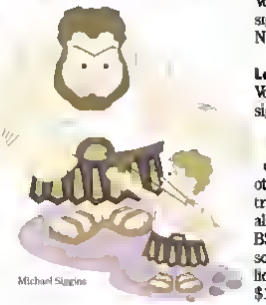

Earlier this month, USL, the 65% AT&T-owned subsidiary, filed a lawsuit in federal court against the University of California at Berkeley, charging 106 counts of patent and copyright infringements, breach of contract and other violations.

It was the second shoe dropping in a lawsuit that USL is pursuing against Berkeley Software Design, Inc. (BSDI), a small software company based in Falls Church, Va.

System base

The university's Networking Release 2 (NET2) Unix source tape — supposedly free of any AT&T or USL copyrighted Unix code — is the foundation of BSDI's BSD/386 operating system, now installed on personal computers at some 300 beta-test sites.

For many of the 300 customers who bought BSDI's Unix operating system, the lawsuit has

Michael Siggins

blown an enormous black cloud over their plans.

"I really like the people at BSDI, but there's no way I would recommend their product to a customer right now," said Phillip Vogel, president of Bartal Design Group, Inc. in Englewood, N.J.

Low license fee

Vogel's seven-employee firm designs specialized electronic equipment, such as the flashing yellow lights on the back of Conrail trains. Like BSDI's other customers, Vogel was attracted by the share and share alike atmosphere encouraged by BSDI, as well as by the $1,000 source license fee. A comparable license from USL would cost $100,000.

BSD (Berkeley Software Distribution) Unix got its start years ago under U.S. Department of Defense contracts, which fueled development of the Unix variant on the Berkeley campus. BSD Unix grew into the beloved child of technical and scientific users, as it offered a variety of enhancements and software development improvements over AT&T Unix.

"You're either a phone company person or a Berkeley person," Vogel said. "That big polarization between the USL people and the BSD people has been there since forever."

For its part, USL claims this lawsuit is necessary to protect its corporate assets and to send a clear message that it will defend its property. From the BSDI point of view, the lawsuit is por-

USL suit raises hackles

CONTINUED FROM PAGE 45

trayed as a harrassment action intended to drive the small firm out of business.

Adding fuel to the furor, USL has so far refused to identify exactly which parts of the code have allegedly been copied in the BSD/386 system. "They're going to continue looking like the bad guys until they get around to showing that some violation really occurred," said Dick Dunn, a BSDI customer and president of Eklektix, a software development and consulting firm in Boulder, Colo.

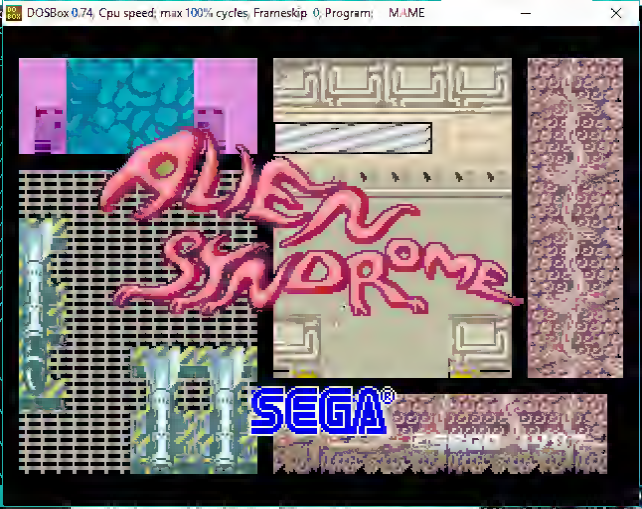

One issue that particularly upsets BSDI's followers is a part of the lawsuit seeking to prevent BSDI from hiring anyone with extensive knowledge of Berkeley Unix source code. That is considered a chilling portent for future code-sharing and Unix development.

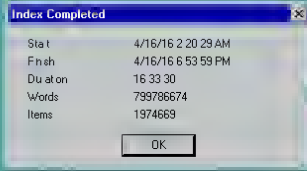

"There is nothing here of concern to Unix licensees," said Larry Lytle, a USL spokesman. "There is nothing for users of Unix technology to worry about and nothing here to concern programmers with extensive Unix knowledge."

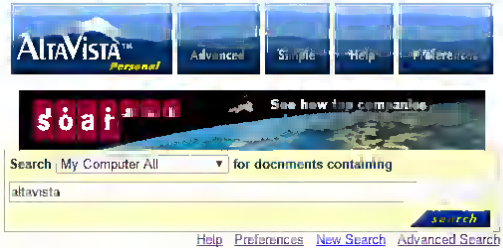

Despite the outcry from one corner of the Unix market, "no one has flat-out denied [that] USL's intellectual property rights" are being violated, noted Maureen O'Gara, publisher of the "Unigram X" newletter. The lawsuit, she observed, has "stirred up a hornet's nest of academic fear and loathing against USL and has created a cadre of naive tech weenies ready to form a lynch mob."

At Unix consulting firm /Sys/admin, Inc. in San Jose, Calif., the BSD/386 operating system is replacing USL's System V, Release 4 Unix, which was plagued with operational problems, company President Bjorn Satdeveza said. "Even if USL wins this lawsuit, there is no way we would continue with SVR4," he said, citing networking problems and system crashes. "We're going ahead with BSDI and hoping for the best."

Analysts who follow the commercial Unix market had little sympathy to spare for BSDI's role as David to the Goliath of USL and AT&T. "The academic communities had free access to Unix source code, and these guys from BSDI thought they could take it and build a business on it," said Rikki Kirzner, a Unix analyst at Dataquest, Inc. in San Jose. "Now USL is is putting the nail in the coffin and right through their heads."

PIGEON BOTHERER

Send ☆ Save APPLY

Recruiter	Polham City Council
Location	City Centre
Salary	£30,000 + benefits
Posted	31 Mar 2016
Closes	29 Apr 2016
Sectors	Travel & Tourism
Contract Type	Contract
Hours	Flexible Hours, Full Time

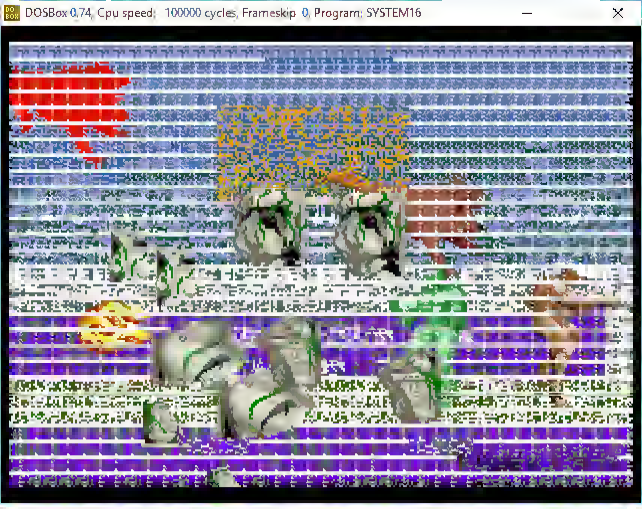

After a numerous amount of complaints from residents and visitors over recent months, the city council is looking for a unique individual to fill the position of 'Pidgeon Botherer' during peak shopping hours in order to keep the flying vermin off of the main high street.

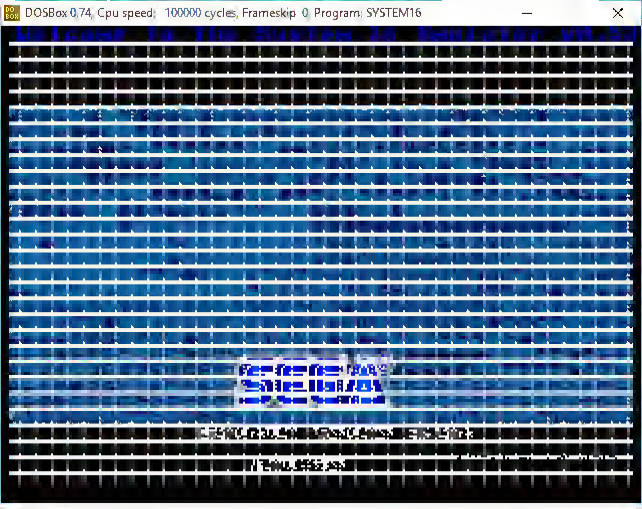

With a competitive salary, a pigeon costume and a poking device all provided by the council, the ideal applicant will be able to show that they can successfully scare the pigeons enough to never return to the area. Creativity and innovation in scaring pigeons is a must.

Open auditions for the role will commence at 9.00am. Costume is optional but very welcome

Release 57 / Serial number

Another routine day of drudgery aboard the Stellar Patrol Ship Feinstein.  This
morning's assignment for a certain lowly Ensign Seventh Class:  scrubbing the
filthy metal deck at the port end of Level Nine.  With your Patrol-issue
self-contained multi-purpose all-weather scrub brush you shine the floor with a
diligence born of the knowledge that at any moment dreaded Ensign First Class
Blather, the bane of your shipboard existence, could appear.

Deck Nine
This is a featureless corridor similar to every other corridor on the ship.  It
curves away to starboard, and a gangway leads up.  To port is the entrance to
one of the ship's primary escape pods.  The pod bulkhead is closed.

 Deck Nine                          Score:  0/4451

Manx Aztec C86
Join The Stampede!

"A compiler that has many strengths ... quite valuable for serious work"
COMPUTER LANGUAGES, 2/85

"Easily one of the fastest compilers overall... library provides a lot of flexibility... small .EXE files."
DR DOBB'S JOURNAL, 8/85

Manx Aztec C86 - Join the Stampede!

If you are programming in C or plan to program in C for MS-DOS, PC-DOS, CP/M-86, or ROM based 8086/80x86 systems, we invite you to join the stampede to Manx Aztec C86. The stampede to the most powerful, portable, and professional C development system available for MS-DOS and CP/M-86.

Manx Aztec C86 - Power to Spare

In benchmarks published in the February, 1985 issue of Computer Languages and the August, 1985 issue of Dr. Dobb's Journal, Manx Aztec C86 again and again came up on top in benchmarks of code speed, code size, and compile times. Dr. Dobb's Journal declared Manx Aztec C86 the winner in the benchmarks, sharing the honor with the new Microsoft C compiler.

Manx Aztec C86 - Unmatched Portability

Only Manx Aztec C is available for MS-DOS, CP/M-86, Apple Macintosh, Apple*II*, TRS-80, CP/M-80, and Commodore systems. No other C system comes anywhere close to supporting the number of microcomputer systems that Manx supports.

Manx also, provides ROM development systems for 8086/80x86, 68000, 8080/Z80, and 65xx systems.

Manx Aztec C86 - Fantastic Features

Manx Aztec C86 is heavily bundled with special features and utilities. Features described below are for the Aztec C86-c and Aztec C86-d systems. Features that are only available with Manx Aztec C86-c are marked (-c).

Optimized C compiler: Unsurpassed for code quality and speed. Optionally generates 80186 and 80286 code. Full K & R.

Symbolic Debugger: Execution trace, break points, display data in floating point, integer, character, or hex format. Evaluate expressions. Detect illegal memory stores, modify memory/registers, disassemble code.

Manx AS86 Macro Assembler: Supports macroes, 8086, 80186, and 80286 instructions in Intel format. Fast execution.

LN86 Overlay Linker: Links small, large, and mixed memory model routines. Supports overlays, and options for producing ROM based code.

Librarian: Build and modify personal or system run time libraries.

8087/80287 Sensing Library: One library simulates floating point, another assumes the presence of an 8087 or 80287 math chip, the third senses the existence of a math chip, and if it finds one it uses it.

Profiler: Provides a run time analysis of your code to pinpoint code segments to optimize.

UNIX Libarary: Compatible with UNIX C. Fast I/O. Terminal I/O can be buffered or unbuffered.

DOS Library: Time and date functions, program forking (exec), program chaining, directory commands, I/O port support, sysint support, BIOS functions, and BDOS functions.

Screen & Graphics Library: Screen and cursor functions. Fast routines for drawing lines, circles, ellipses, points, and setting colors.

CP/M-86 Library (-c): Produce programs for CP/M-86.

Large Memory Model: Manx Aztec C86 supports programs and data of any size. Global data has a max size of 64k.

Intel Object Option: Interface to software that requires Intel object format, such as PLINK-86.

Z (vi) Source Editor (-c): Fast, powerful editor, macro capabilities, undo, ctags, buffers for commands and data, and all the bells and whistles that make vi fanatics fanatical.

ROM Support Package (-c): Startup routine, linker options for separate placement of code and data, special utilities like the Intel HEX Utility, documentation, and library source.

Library Source Code (-c): UNIX, screen, graphics, and math function libraries.

Mixed Memory Models (-c): Mix large code and small data, small code and large data, or mix within type.

UniTools (-c): The UNIX utilities make, diff, and grep.

One year of updates (-c): As new versions are released, updates are automatically sent.

Technical Support: Manx has a full time staff to provide support via telephone & bulletin board.

Aztec C86-c Commercial System	**$499**
Aztec C86-d Developer's System	**$299**
Aztec C86-p Personal System	**$199**
Aztec C86-z Apprentice System	**$ 49**

Manx Cross Development Systems

Manx Aztec C compilers are available as native or as cross development systems for PC-DOS, MS-DOS, Macintosh, CP/M-86, CP/M-80, TRSDOS, Apple II, and Commodore 64/128.

Cross development involves two computer systems: the development system (HOST) and the executive system (TARGET). This method is useful when the TARGET machine is slower or more limited than the HOST.

HOSTS: VAX UNIX ($3000), PDP-11 UNIX ($2000), MS-DOS ($750), CP/M ($750), Macintosh ($750), CP/M-68k ($750), XENIX ($750).

TARGETS: MS-DOS, CP/M-86, Macintosh, CP/M-68k, CP/M-80, TRS-80 3 & 4, Apple II, Commodore C64, 8086/80x85 ROM, 68xxx ROM, 8080/8085/Z80 ROM, 65xx ROM.

Additional TARGETS are $300 to $500 (non VAX) or $1000 (VAX). Call for information, on cross development to the 68000, 65816, Amiga, C128, CP/M-68K, VRTX and others.

How To Become a Manx-Aztec C User

Call 1-800-221-0440 or 1-800-832-9273 (800-TECWARE). In NJ or outside the USA call 201-530-7997. Orders can also be telexed to 4995812.

Payment can be by check, COD, American Express, VISA, Master Card, or Net 30 to qualified customers.

Orders can also be mailed to Manx Software Systems, Box 55, Shrewsbury, NJ 07701

For More Information: call 1-800-221-0440, or 201-530-7997, or write to Manx Software Systems.

Support Software for Manx Aztec C86

Discounts are available on many items listed below. Call Manx for details.

C-tree $395. B-tree database system. Easy to use. Available for Aztec C for MS-DOS, Macintosh, CP/M-86, CP/M-80, and others. Includes source.

PHACT $250: Powerful database system. Available for Manx Aztec C compilers for MS-DOS, CP/M-86 and CP/M-80.

PANEL $295: Create screens via simple, powerful editing commands. Select colors, edit fields, Directly input data to a multi-keyed file utility.

SunScreen $99: Create and modify formatted screens easily. Validate fields, select colors, create screens for both the color and monochrome cards. With library source SunScreen is $299

Windows for C $195: Versatile window utility that supports IMB PC compatible and some non-compatible environments.

HALO $250: The ultimate C graphics package. It supports viewports, shapes, and multiple graphics cards. A less expensive version is available for just the PC mono and color cards.

FirsTime $295: Syntax checking while you edit greatly shortens compile time.

Pre-C $395: Powerful Lint-like utility locates structural and usage errors. Easily checks multiple files for bad parameter declarations and other interface errors. Lint users will find the user interface a dream come true.

PC-LINT $98: Link-like utility that supports large memory models, has clear error messages, and executes quickly, has lots of options and features that you wouldn't expect at this low price.

Greenleaf Functions $185: Source for over 200 C and assembler functions.

C Utility Library $185: C and assembler source for screens, windows, color graphics, asynch communications, and more. The color graphics and speed of this package are impressive.

PLINK-86 $395 MS-DOS linkage editor for producing and maintaining overlayed programs. It works with Aztec C86 in Intel object format mode.

Discounts

Discounts are available to professors, students, small businesses, and consultants. A discount is also available on a "trade in" basis for users of "brand x" C compilers. Call Manx for details.

30 Day Satisfaction Guarantee

Any Manx Aztec C system can be returned within 30 days for refund if you are not satisfied with your purchase. Only systems shipped within the USA by MANX directly to the end user are eligible for return. Refunds will not include shipping costs and a small restocking fee may be charged.

Distribution of Manx Aztec C

In the USA, Manx Software Systems is the sole and exclusive distributor of Aztec C. Any telephone or mail order sales other than through Manx are unauthorized. Manx Aztec C is sold at some retail outlets under license to Manx.

Additional Troubleshooting

Please read this flyer for important information not available in the *on-line Clik! Drive User's Manual*. For additional assistance, visit us on the Web at www.iomega-europe.com.

The Clik! PC Card Drive is not detected by my system.

Troubleshooting tips for this problem can be found in the Troubleshooting section of the on-line Clik! PC Card Drive User's Manual located on the CD. In addition to that information, you can try one of the following solutions:

Uninstall any version of the Card Drive software. For...

The Clik! PC Card Drive does not work on my notebook PC running Windows NT.

The Clik! PC Card Drive does not support the Windows NT operating system. If you try to use the Clik! PC Card Drive on a notebook running Windows NT, you may or may not have success. This is primarily dependent on the proprietary software your notebook manufacturer installed to control the type II PC Card slots. You may wish to check with your notebook manufacturer to see if they have updated software that will support the Clik! PC Card Drive.

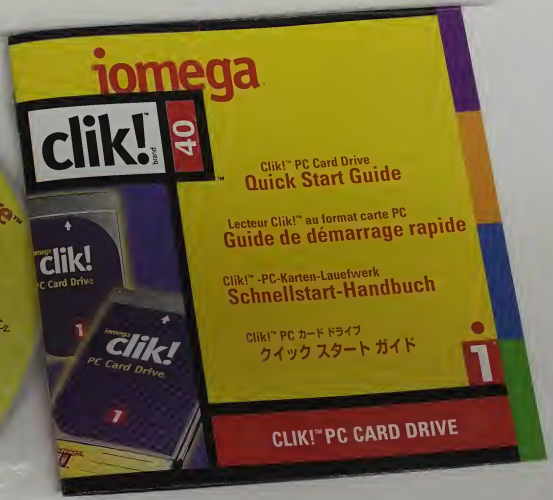

The Clik! PC Card Drive does not fit into my PC Card Slot.

The Clik! PC Card Drive may not fit into all notebook computers due to the tight tolerances and potential variance in the manufacturing of notebook computers. If the Clik! PC Card Drive does not fit into the Type II PC Card slot, try a different slot or remove any other PC card from the other PC card slots.

Good Afternoon
Welcome to RSX-11M-PLUS
Version 4.6 Base level 87
This is Mim Update.00 SE
(Running on E11)
If you have any problems, or want to ask questions, don't
be afraid to write me a mail.
MIM is a E11 replacement for Magica, which can't be run 24/7 right now
because of costs Magica is still around, and occasionally online
The E11 license for MIM was kindly donated by John Wilson of DBIT.
Check out www.dbit.com for more information

[illegible] atonsyummeh December 9, 2016

★★★★★

Best one out of 7 Google had forced me to download like 7 of these now and only this one works! Get out of my face google and hope pop ups dont come up again saying google has detected (2) viruses. You only have 30 seconds 😡

R

Roland Gilmore November 30, 2016

★

This app blows I just dont want these pop-ups preventing me from doing anything productive on the internet. Whoever decided this was an okay way to market the rjoke of an app is an a**hole. Seriously if you dont want pop-ups download this app. Then once you do, leave them nasty feedback about how they are. Well I am sure you can figure out how to finish that.

K

Kristen Swallener November 1[illegible], 2016

★★★

Worked out nicely I hate the fact that every time I tried to do anything on the browser the page that MADE ME download this app was there but after that OBNOXIOUS FACT it works pretty well

[illegible]lass [illegible]ro [illegible]016

★★★★★

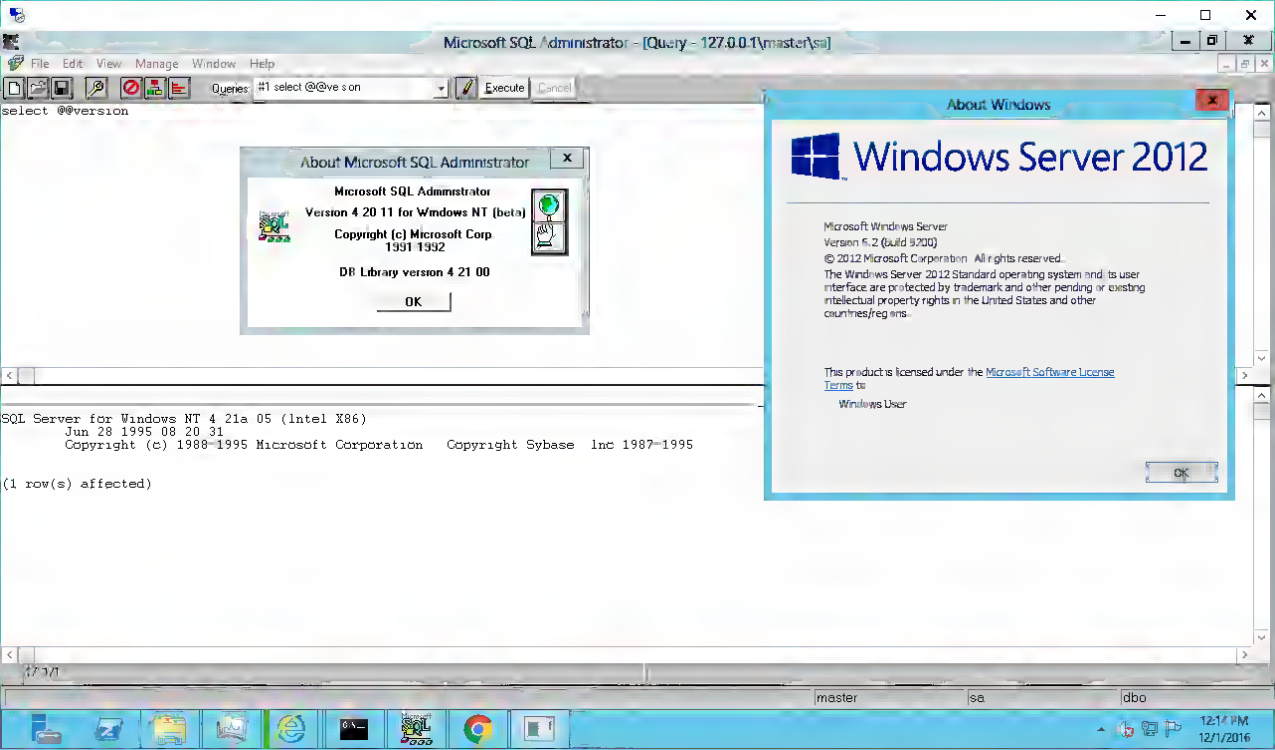

Came in handy My phone suddenly started having a fit and then a window popped up saying my [illegible] had a virus. Luckily I downloaded this app and now my phone works just like when I bought it.

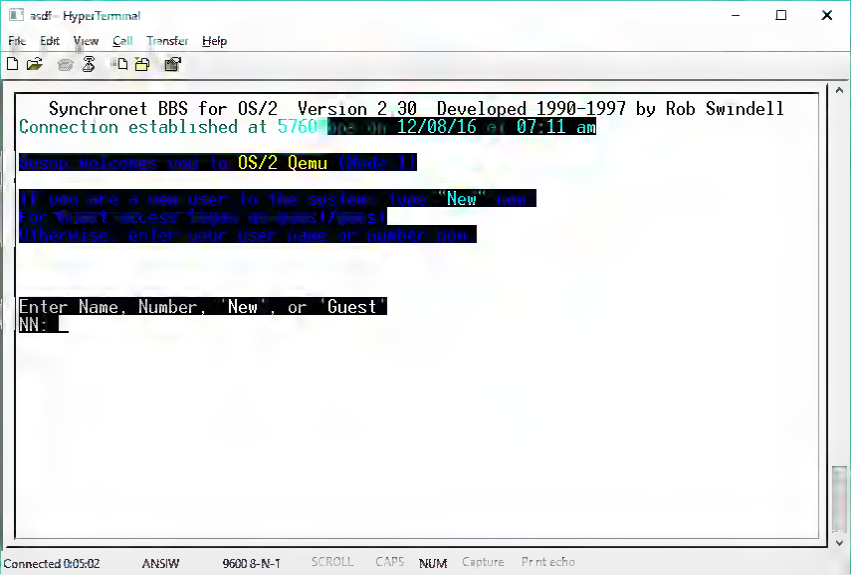

C

cody roberts [illegible]ovember 2[illegible], 2016

★

Scam I was tricked into download ing this by a fake ad the threat need to turn me into the FBI for looking at a porn site. Ha this is so fake. Don't fall for this bad app. Uninstalled immediately

Getting Started

What is vCenter?

The vCenter inventory is where you find all the objects associated with vCenter Server systems, such as datacenters, hosts, clusters, networking, storage, and virtual machines.

The Inventory Lists allow you to view an aggregated list of these objects across vCenter Server systems. These flat lists enable easier batch operations.

The inventory tree is still available under Inventory Trees. Here objects are listed hierarchically in four categories: Hosts and Clusters, VMs and Templates, Storage, and Networking.

There are three steps to getting started with your virtual infrastructure:

1. Create a Datacenter
2. Add hosts to the Datacenter
3. Create virtual machines on the hosts

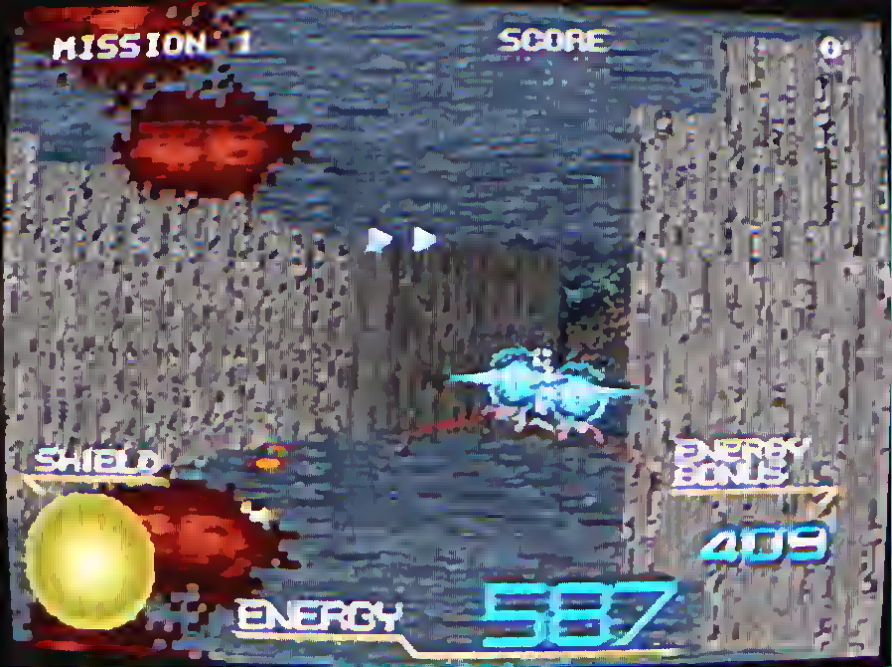

To get started, select an inventory item on the left.

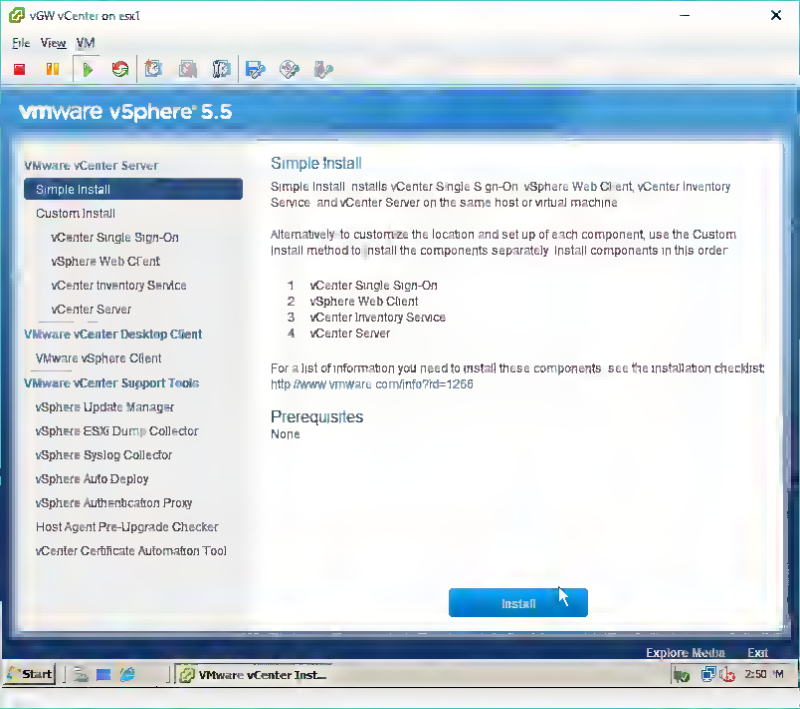

Explore Further

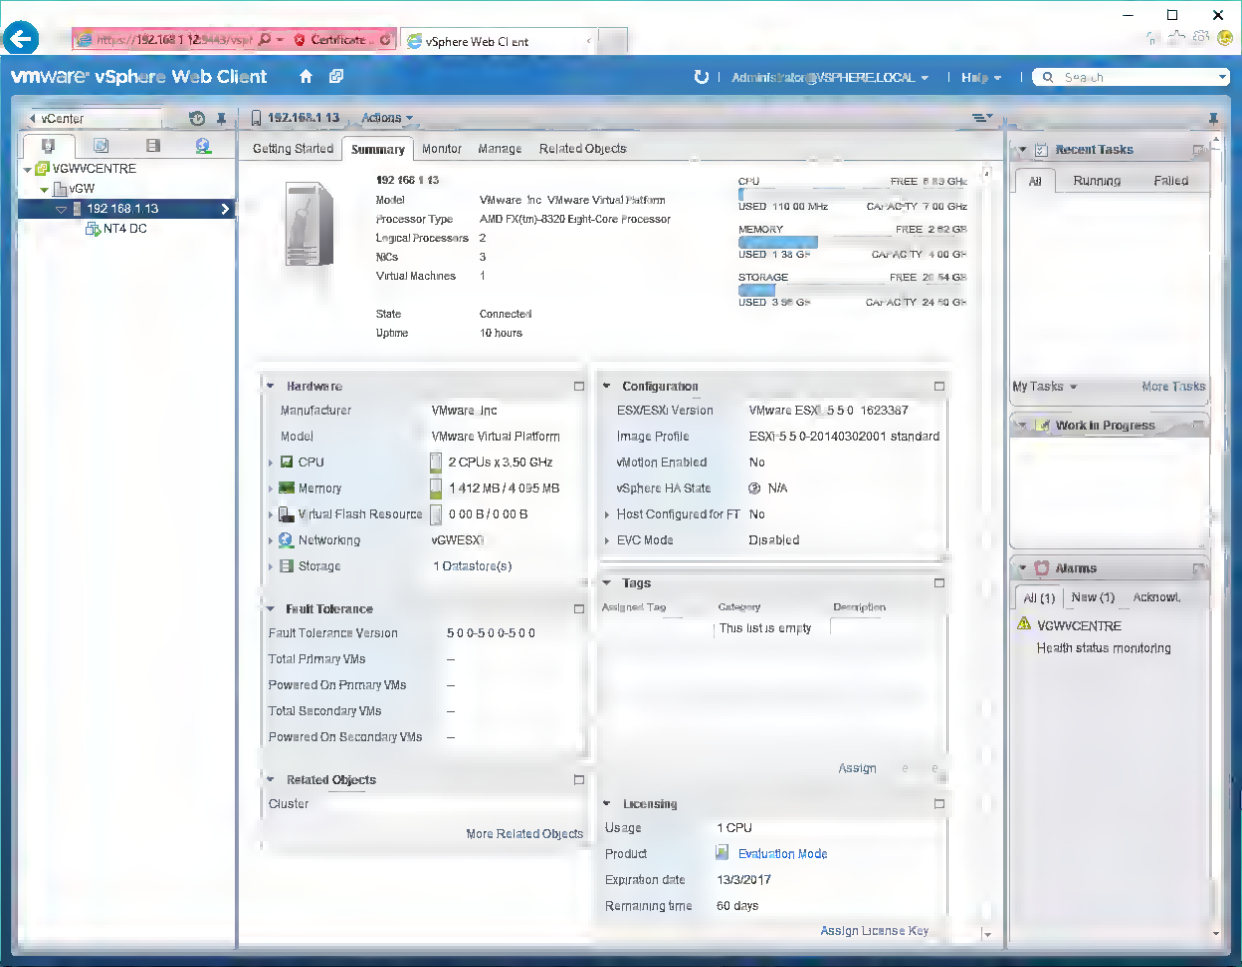

- What is vCenter Server?
- Networking in vSphere
- Storage in vSphere
- What are inventory tree views?
- Using the object navigator

Use default settings
ESX can automatically determine if a virtual machine should use hardware support for virtualization based on the processor type and the virtual machine. However, for some workloads, overriding the automatic selection can provide better performance.
Note: If a selected setting is not supported by the host or conflicts with existing virtual machine settings, the setting will be ignored and the "Automatic" selection will be used.
Automatic
Use software for instruction set and MMU virtualization
Use Intel® VT-x/AMD-V™ for instruction set virtualization and software for MMU virtualization
Use Intel® VT-x/AMD-V™ for instruction set virtualization and Intel® EPT/AMD RVI for MMU virtualization

Harris expands HCX system of superminis

Harris Computer Systems has added the entry-level HCX-5 system to its HCX family of Unix-based superminicomputers. According to the company, the HCX-5 achieves five million instructions per second and was designed for departmental applications.

The system features a 40M-byte-per-second VMEbus. It is reportedly completely compatible with other members of the HCX family.

The HCX-5 supports up to 128 users and serves as a departmental computer linking PCs, terminals, and engineering workstations, as a compute and file server, or as a gateway to other superminicomputers and mainframes, according to Harris. It supports Ethernet, NFS, Unix remote functions, X.25 wide-area networking, DARPA Internet protocols, and IBM BSC and SNA.

The HCX-5 operating system, HCX/UX, permits access to AT&T Unix System V.2 and University of California at Berkeley 4.2 BSD environments.

The HCX-5 costs from $124,500.

Reader Service 55

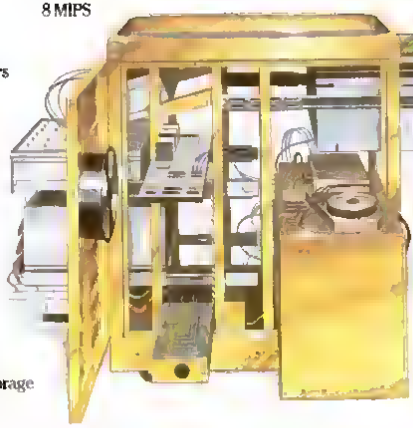

The Harris HCX-5 joins the HCX family of Unix-based 32-bit superminicomputers. It is rated at 5 MIPS using the C language.

I/O, I/O
IT'S OFF TO WORK
WE GO.

8 MIPS

Throughput Two 40 MB/Sec. VMEbuses

Up to 256 Users

Up to 128 MB Memory

DualUniverse UNIX. AT&T and Berkeley

Open Architecture

NFS, Ethernet, X.25 and SNA

Up to 17 GB Storage

INTRODUCING THE HARRIS HCX-9 COMPUTER.

It's no fairy tale.

Our new UNIX™-based Harris HCX-9 eliminates your I/O bottleneck. Because it can serve more users and execute more transactions, with faster response. That should make you whistle while you work.

The HCX-9 features the industry standard VMEbus with enhancements for faster I/O throughput. It also supports standard communications through local and wide area networking, so it will fit in with your current systems.

We offer a host of systems and application software that are nothing to sneeze at.

And it's easy to port software to the HCX-9, if it's not already in our catalog. In short, the new Harris HCX-9 is a full function system with a small footprint, an impressive growth path and a name behind it you can believe in.

So don't be bashful. Find out how the HCX-9 can meet all your computing requirements at a price that won't make you grumpy.

For information write Ron Baker, Harris Computer Systems Division, 2101 W. Cypress Creek Road., Ft. Lauderdale, FL 33309.

Or call 1-800-4-HARRIS, ext. 4029.

Then it's off to work you go.

HIGH PERFORMANCE COMPUTER SYSTEMS FOR THE WORLD'S MOST DEMANDING USERS.

HARRIS

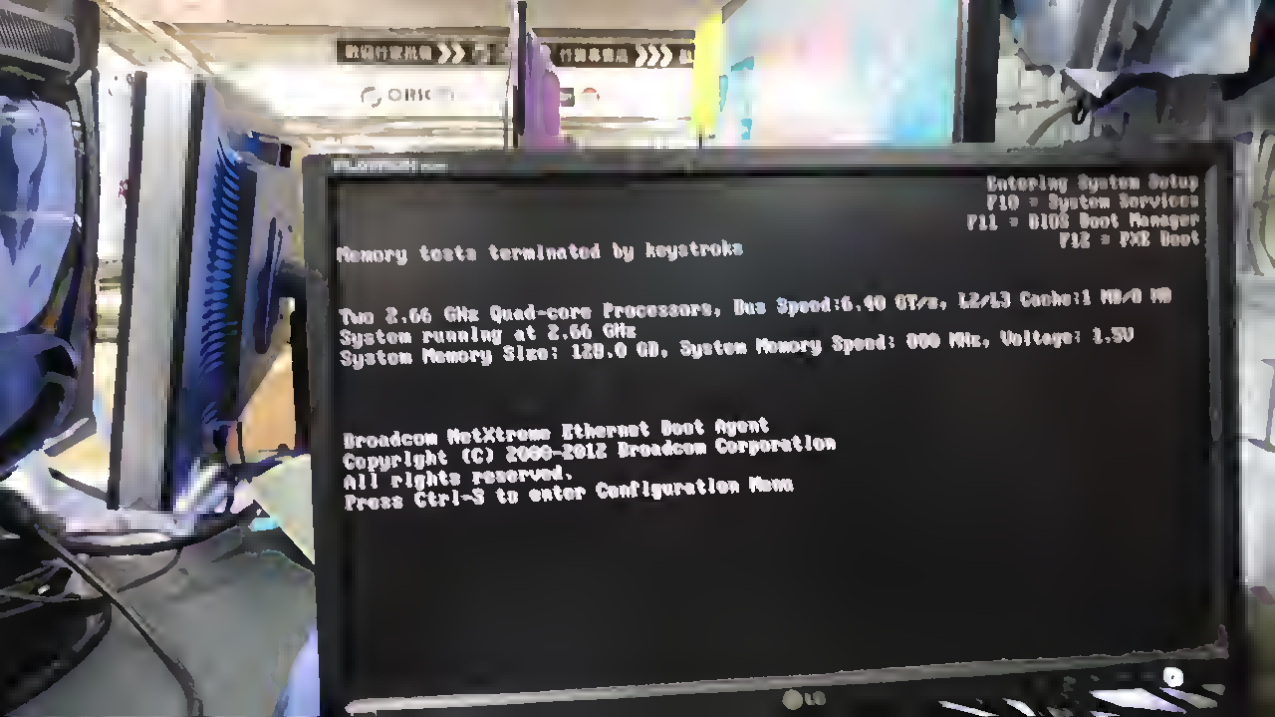

database via satellite is featured as well as a wall of clients showing multimedia applications being driven from a single server.

IBM Power Personal Systems Booth L882

The IBM Power Personal System Division is introducing and demonstrating technologies featured on its family of personal workstations. The Personal Workstations marry the high performance PowerPC RISC microprocessor with industry-standard PC components. The PowerPC is featured with new human interfaces, integration of multiple operating systems environments on a single platform, and the latest in operating system, multimedia and collaborative computing technologies. OEMs, IHVs and ISVs can explore how they can use these technologies (Preview)

ORACLE WORKER.

DOLLAR FOR DOLLAR, ORACLE™ WORKS MORE EFFICIENTLY ON HARRIS COMPUTERS.

It's a wonder. The wizardry of Harris computers makes ORACLE DBMS software work harder for less money. Less money than IBM and DEC. In fact, the Harris H800 concurrently supports greater than 100 users at significantly less cost per user.

And Harris is the only source offering a complete range of hardware, from micro-boards to super-minis, that supports ORACLE in a UNIX® environment. We also offer other leading software products for office automation and project management.

And our extensive networking capability such as NFS, Ethernet, DDN and SNA provide for flexibility and a complete growth path.

Harris has a strong commitment to ORACLE. We were the first ORACLE OEM and the first to deliver distributed database capabilities.

When you decide it's time for ORACLE to go to work for you, make sure you learn it with the hardest-working systems.

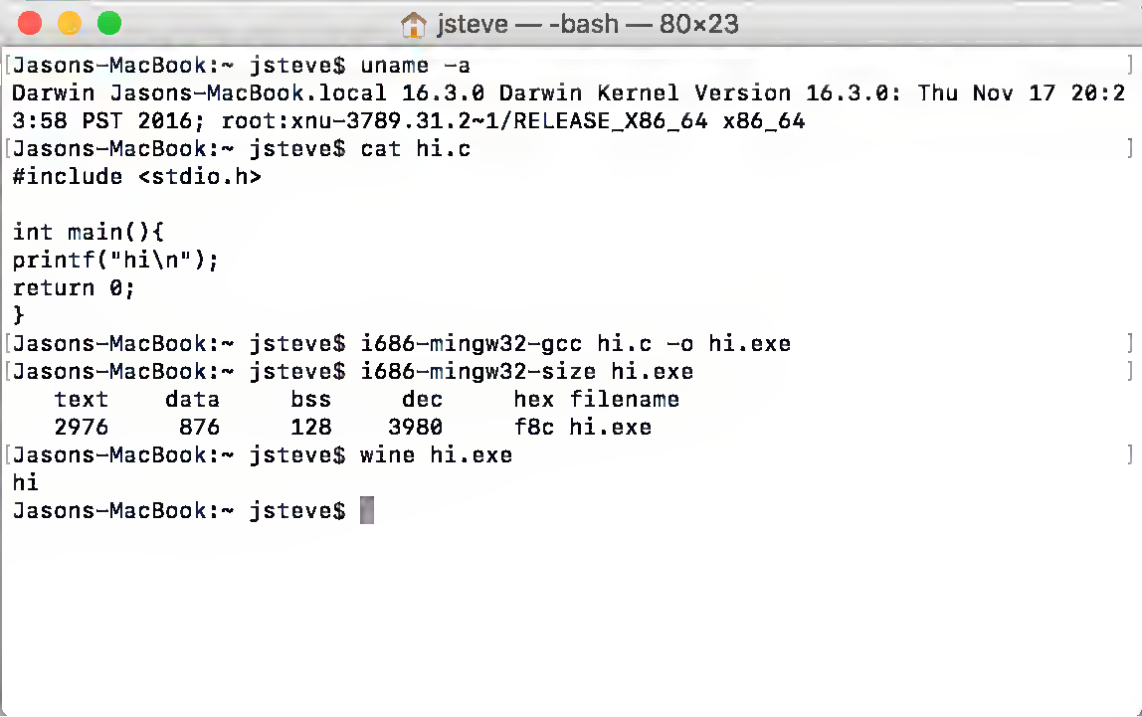

To see how fast ORACLE works on Harris computers, write Ron Baker, Harris Computer Systems Division, 2101 W. Cypress Creek Road, Ft. Lauderdale, FL 33309.

Or call 1-800-4-HARRIS, ext. 4054. At Harris, wonders never cease.

Price Performance Comparison Based on Data from The Winchester Report Release May, 1986.

Hello NeXT community ; I'll be happy to upload any public domain software to the site. I don't believe there is anything legally wrong with it and if any issues were to develop I'll just delete any files in question. I'm also willing to send a few emails and simply ask for permission.

I uploaded packages here thanks M... I thought this was currently the most relevant location on the site as it is on topic but there may be other ones in the future.

http://www.nextcomputers.org/NeXTfiles/Software/Virtualization/VMWare/Source/driverkit-139-1-1.tar.gz
http://www.nextcomputers.org/NeXTfiles/Software/Virtualization/VMWare/Source/kernel-1.tar.gz

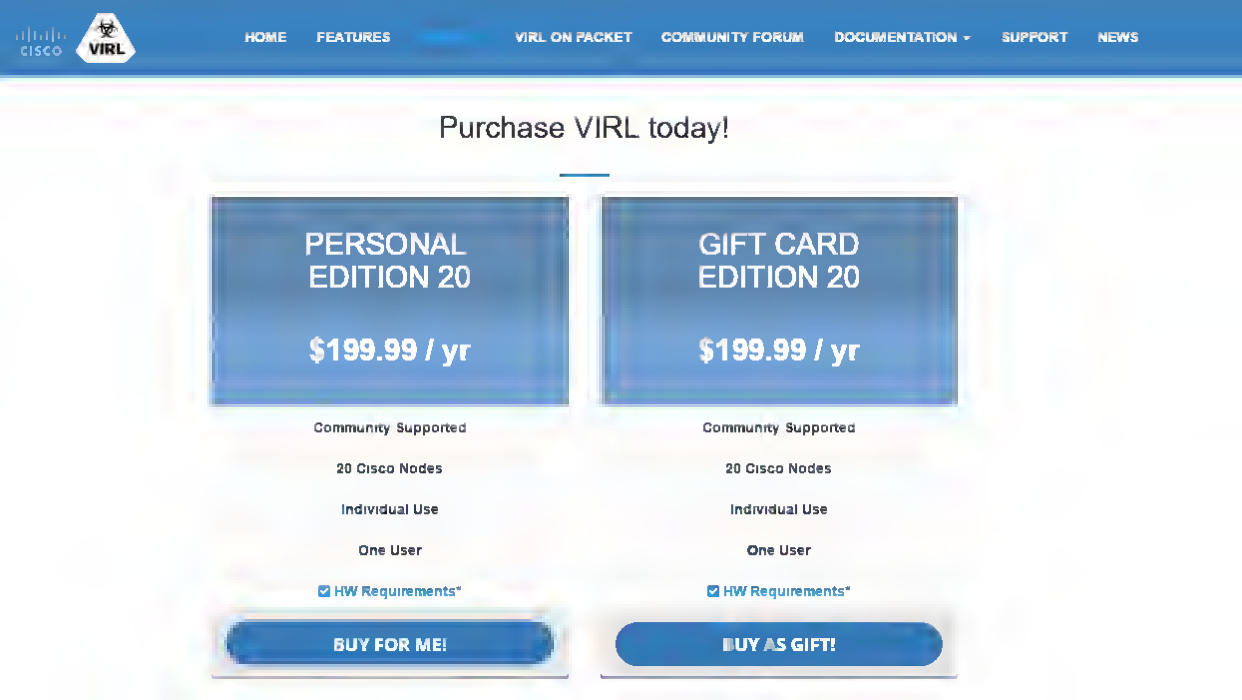

If anyone perceives any problems developing with providing this old public domain source to the NeXT community or has questions please feel free to pm my hearts in it.

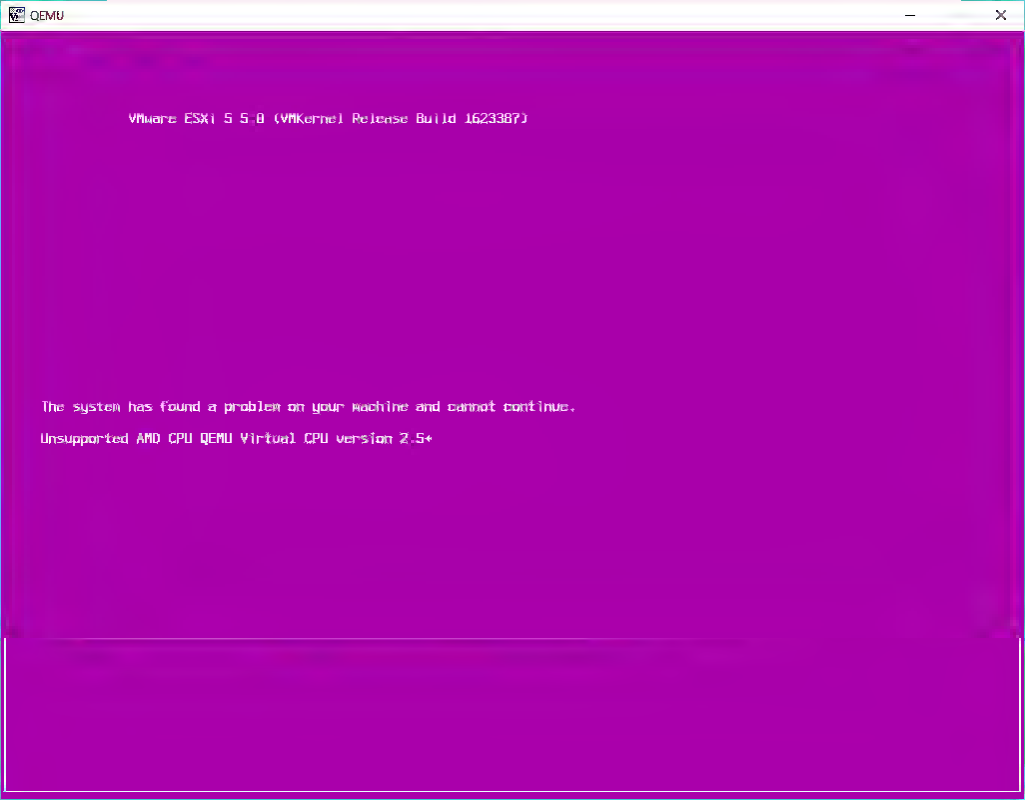

Best regards Rob

Welcome to Eighth Edition Unix. You may be sure that it
is suitably protected by ironclad licences, contractual agreements,
living wills, and trade secret laws of every sort. A trolley car is
certain to grow in your stomach if you violate the conditions
under which you got this tape. Consult your lawyer in case of any doubt.
If doubt persists, consult our lawyers.
Please commit this message to memory. If this is a hardcopy terminal,
tear off the paper and affix it to your machine. Otherwise
take a photo of your screen. Then delete /etc/motd.
Thank you for choosing Eighth Edition Unix. Have a nice day.

Microsoft® Internet Information Server

The Web Server Designed For Windows NT Server

Why not add the latest features to your Internet Information Server?

Books Online

Microsoft® Internet Information Server (IIS) makes it easier to do business with internal or external customers down the hall or around the world. To learn more about how Internet Information Server will help you in your business, browse the IIS online documentation.

Administrative Tools

You can manage the IIS services from a Web browser. To start the administration tool in your current Web browser, click here. (Note: You must have administrator privileges to use this tool.)

Sample Pages & Application Ideas

- Sample Site
- Database
- Programming
- HTML

Try the hyperlinks above to see some examples of the content you can publish with Microsoft Internet Information Server. To learn more about Microsoft products that you can use to create great-looking Web pages, visit the Microsoft Web site for information about Microsoft FrontPage and Internet Assistants for Microsoft Office. Microsoft FrontPage is also included on the Windows NT Server CD-ROM.

Microsoft On The Internet

A good place to begin browsing the Internet is www.microsoft.com, where you will find information about Microsoft products. This Web site contains pages that discuss Microsoft Internet Information Server. The Microsoft Web site also provides downloadable versions of Microsoft Internet Explorer. Another good place to start browsing is The Microsoft Network Web site.

root device? sd0
rootdev 600 howto 40001
WARNING preposterous time in Real Time Clock CHECK AND RESET THE DATE
Power management is enabled
Load of /sbin/mach_init errno 2 trying /etc/mach_init
Root device is mounted read-only
Filesystem checks skipped
You are now in single-user mode while booted from a CD-ROM
Since the root disk is read-only some commands may not work as
they normally do. In particular commands that try to create
files in /tmp will probably fail. One way to avoid this problem
is to mount a separate hard disk or floppy on /tmp using the
mount command. For example /etc/mount -n /dev/fd0a /tmp puts
/tmp on the internal floppy disk. (The -n option prevents mount
from trying to record the mount in /etc/mtab.)

The Next Stage in Software Evolution

The future of software development is here! Open Source software has proven to be a powerful, efficient means of developing robust, portable code, and Apple Computer is proud to be on the leading edge of corporate open source efforts.

We are proud to offer you the premier volume of the Darwin Open Source SDK.

This CD contains the latest versions of all Apple Open Source software projects including

- Darwin OS Release 0.3 (source code & installers!)
- Darwin Streaming Server Release 1.0.1
- OpenPlay Release 1.0

The CD mirrors the information available on the Public Source web site but is arranged on a convenient CD-ROM so that you don't have to deal with bandwidth constraints. Of course, you should be sure to check out the web site at www.apple.com/opensource to find the latest updates, mailing lists, news, and future directions.

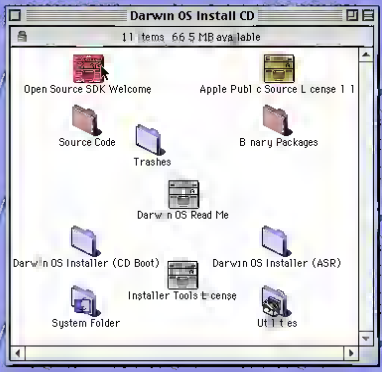

Come help us build the future of the Macintosh—together.

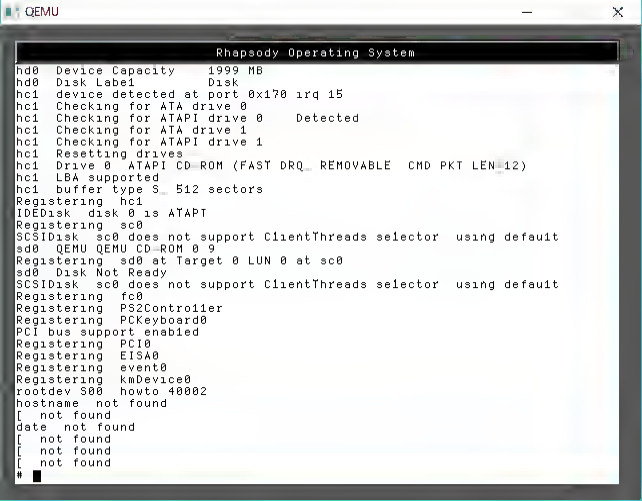

© 1999 Apple Computer, Inc. All rights reserved. Apple, the Apple logo, and Macintosh are trademarks of Apple Computer, Inc., registered in the U.S. and other countries. DESIGN.

Windows Security Alert
Windows Firewall has blocked some features of this app
Windows Firewall has blocked some features of tacacsd.exe on all public and private networks
Name: tacacsd.exe
Publisher: Unknown
Path: D:\dynamips\tacacs\tacacsd.exe
Allow tacacsd.exe to communicate on these networks:
Private networks, such as my home or work network
Public networks, such as those in airports and cafes (not recommended because these networks often have little or no security)
What are the risks of allowing an app through a firewall?
Allow access

An era-defining RPG. SEGA's landmark sci-fi epic comes to mobile. Play for free and experience one of the most acclaimed games of its generation.

An era-defining RPG. SEGA's landmark sci-fi epic comes to mobile. Play for free and experience one of the most acclaimed games of its generation.

Team up with an unlikely ensemble of characters to thwart evil spreading across the once-peaceful Algo Star System. Combat mutants and robots, collect a plethora of equipment, and unravel the mystery behind one of the greatest RPGs of all time.

Phantasy Star II joins the SEGA Forever classic games collection, a treasure trove of free SEGA console classics brought to life on mobile for the first time!

GAME FEATURES

- An epic campaign lasting over 30 hours
- Classic 16-bit turn-based combat
- Battle against the mutants, robots, and other fierce creatures of Motavia, Dezoris, and Palma
- All manner of weapons to get to grips with, including laser swords, pulse cannons, and fire staves
- Eight playable characters, each with their own unique traits and skills

SEGA FOREVER FEATURES

- PLAY FREE
- SAVE YOUR GAME PROGRESS AT ANYTIME
- CONTROLLER SUPPORT – fully integrated wireless Bluetooth controller support
- OFFLINE PLAY
- GAMES RELEASED EVERY MONTH – download them all!

RETRO REVIEWS

- An excellent game that will have you hooked from the first minute to the last – which, with the weeks, if not months, away. [94%] - SEGA Power #15 (February 1991)
- "A challenging quest packed with gameplay" [90%] Paul Pighy, Raze Magazine #5 (April 1991)
- "If RPGs are your bag, you couldn't do better." [89%] - Zero #17 (March 1991)
- "There are few Mega Drive titles that can compete with Phantasy Star II in the lasting appeal department." [807/1000] - Eugene Lacey, ACE #37 (October 1990)
- "This is the game that set the standard that all further Mega Drive RPGs had to follow." [88%] - MEGA Gold Summer Special (1993)
- "It's big, it's lovely, it's varied – it's magic. It's Phantasy Star II." [88%] - MEGA #18 (March 1994)

TRIVIA

- A remake of the game was made for the PlayStation 2 in Japan, titled Phantasy Star Generation 2.
- Eight Phantasy Star II text adventures were made released to players with a SEGA Meganet subscription in Japan.
- The game shipped with a 110 page guide book and map in the US and UK to help guide players through.

CLASSIC GAME FACTS

- Originally released in Japan in 1989, with US and European releases following in 1990 and 1991.
- The first game to use a 16 Megabit cartridge.
- The first 16-bit RPG release in the West.
- Programmed by Yuji Naka, creator of Sonic the Hedgehog.

Part 2 of a look back at the 1980's, a review of Sierra's The Colonel's Bequest, VGA Games, Music cards, and more

The Eighties, A Decade Gone By

The eighties belong to the computer. These were the years where terms like floppy disks, chips, graphics, keyboard, Poc-Man, RAM, etc. become very familiar. Video Games existed in the seventies but it wasn't until the eighties that they really took off. The early eighties began with the 2600 and 5200 game machines. Also on the market were Mattel's Intellivision, Coleco-Vision, and the Odyssey. The video arcade was dominated by Philly's Space Invaders, Poc-Man, Atari's Asteroids, Centipede, and a new unknown competitor, Nintendo, released their hit game Donkey Kong. Around this time Apple II's, and Atari 800's were the most popular home computers but these 8bit releases had their days numbered. Within a few months of each other, the IBM PC and ASCII text versions of many popular games. Jumping is credited to Jump Man, Mario Bros., Super Mario Bros., Centipede, and BUGS on the IBM. & there were numerous Train-type games where players try to surround their opponent by creating a wall around them. Continued on P.3

Welcome to the Second Issue of GIF News!

Home & Hobby Inc. Presents Our Newest Addition

Happy New Year!!!

Sysops: If you want GIF News uploaded to your BBS, please mail me a registered user account under my name along with a password to my address. I will then upload every new issue to your BBS. Note: This applies only to BBS's in the US that support 9600 or 2400 baud.

The Colonel's Bequest

Sierra has entered a new genre in 3-D animated "storytainment" with this graphic adventure game with adventure, science fiction, drug dealers, passionate love, an American history, and out gruesome murder! The Colonel's Bequest is a classic murder mystery game in 3-D format. Mystery fiends have their choice of murder sequence in this game. Yippee!

Anyway, you are invited to your friends uncle's estate on an island in Bayou country, Burin. Gimmer the reason that you're invited is a mystery, except you will inherit a share of his estate when he dies. Soon after the guests are killed off one by one. It is up to you to find out who the murderer is. You will go around questioning various guests and search for clues. As you are sleuthing around, time goes by, and the game progresses. It's kinda like real time, the current time. The plot will come up only when you observe or talk something special. The plantation estate is only a small part of Sierra's vast world.

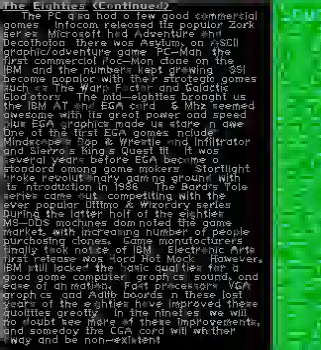

The game itself contains many gimmicks to tempt you into purchasing it. Some of the gimmicks are: Adverb: While on the designers have created a cast of characters that seem almost human. Each have their own individual personality traits.

The game comes packaged with a manual, a small reference guide for documentation.

Overall, I like the game. A copy of the condition, a brief description of the characters and so on, one new innovative feature that I must applaud Sierra for is the Stick-Click option. With this option, you can identify any object or information on the screen. As more trying the determine we some objects suggest, you can use the mouse cursor over the object and hold the shift and press the left button. Or you can use the Alt-Space-Bar button mouse. The game retails for $59.95

The Eighties (Continued)

The PC was had a few good commercial games from Sierra Online's popular Zork series. Microsoft had Adventure and Decathlon. There was Asylum, an MSDOS program/adventure that was the first commercial Doc-Mon done on the IBM and the number kept growing. Soon became popular with these strategy games such as The Wars For Ter and Galactic Conquerors. Throughout the 80s, most us the IBM AT and EGA card & Mhz seemed awesome with its great power and speed due EGA graphics made it awe One of the first EGA games include Mindscape's Top & Wrestle and Infiltrator and Arcade Kings & Quest. Several years before EGA became o standard among game makers. Shortlight broke revolutionary ground with its ntroduction in 1986. The Ogres Tole series came out competing with the ever popular Ultima & Wizardry games. During the latter half of the eighties MS-DOS computers made a huge market with increasing number of people purchasing clones. Game manufacturers finally took note of IBM's Everything. Its first release was Word Hot Mock. However, IBM still lacked the basic qualities for a good game computer, graphics, sound, and ease of animation. Fast precessor, VGA graphics and Adlib boards in these last years of the eighties have improved these qualities greatly in the nineties we will no doubt see more of these improvements, and someday the EGA card will wither away and be non-existent

Sound Cards (Continued)

At the higher end of the adder is the Roland MT-32, complete with its own PSU. You'll probably hear the best sound with the Roland.

Of all the music cards on the market, I'd have to say I suggest getting the Adlib, since it is supported by the most number of programs. The Sound Blaster is the way to go if you're sour on speakers and young to musical reviews. Plus the digitizer is a nice added feature. If you're musician who wants to make some serious stuff, get the Ratana card, for it will serve your needs to infinity

The Best VGA Games

1989 has been a year for the VGA. The following games I consider to have outstanding VGA graphics (with no regard to order):

- Tongue of the Fatmen
- Sudekan
- Rapmaluus
- Star Flight II
- War on Middle Earth
- Dark Lord
- Ultima V
- Wind Walker
- Taradon
- F-15 Strike Eagle
- M1 Tank Platoon
- A-10 Tank Killer
- Mean Streets
- Crime Wave
- Star Trek V
- Star Glider I

The Rumor File

Here's some dirt. Uncontrimed and maybe untrue --

* The release of Windows 3.0's peekaneek due to the fact that IBM says it will be competing with its OS/2.
* Chronosys Inc. to release its Word Perfect 5.0 which will have a graphical interface.
* Word Perfect spokesperson would not after any comment.
* Expect chip prices to level off very soon.
* New Game releases:
  - Centurion: Defender of Rome by Electronic Arts
  - Heroes of the Lance
  - Mind Tech
  - Sands of Fire
  - Second Front
  - Star Trek: Jarns of Klingon Chall
  - Dragon's Lair

GIF News Public Service Ad

Stop Employee Theft

Employee theft costs businesses, small or large, a large amount of money each year. No matter how many reasons you can think of to justify it, it is still stealing. If you feel you are underpaid, the solution is not to steal, but to talk to your boss. Employee theft was a major cause for one GIF based electronic retail chain to file for bankruptcy. Us consumers end up footing the bill for a few unscrupulous individuals. Whether you are in manufacturing, retail, or a service industry, employee theft affects all. Please do your share and STOP EMPLOYEE THEFT! Report any covert activities to your boss.

Test Drive Sun Grid

Simple, affordable access to compute power.

Get Started »

Overview | Customer Reviews | Scott McNealy Interview

Today Sun launches Internet based access to a public compute utility called Sun Grid. Now anyone in the U S can get flexible metered access to enormous computing power over the network for the affordable pr ce of $1/CPU-hr

Easier-Use Computing (2.16)
Sun COO explains how Sun Grid can help you quickly solve complex computational problems and speed time to results without own ng and operating your own data center

Licensing Modes

Windows NT Server supports two client licensing modes. Please select the mode you want to use.

- (•) Per Server for 10 concurrent connections
  Each concurrent connection to this server requires a separate CLIENT ACCESS LICENSE.
- ( ) Per Seat
  Each computer that accesses Windows NT Server requires a separate CLIENT ACCESS LICENSE.

Use License Manager (located in Administrative Tools program group) to record the number of CLIENT ACCESS LICENSES purchased and avoid violation of the license agreement.

Windows NT Setup
Windows NT 4.00 has been installed successfully.
Remove disks from floppy drives and compact discs from CD-ROM drives and choose Restart Computer.
Restart Computer

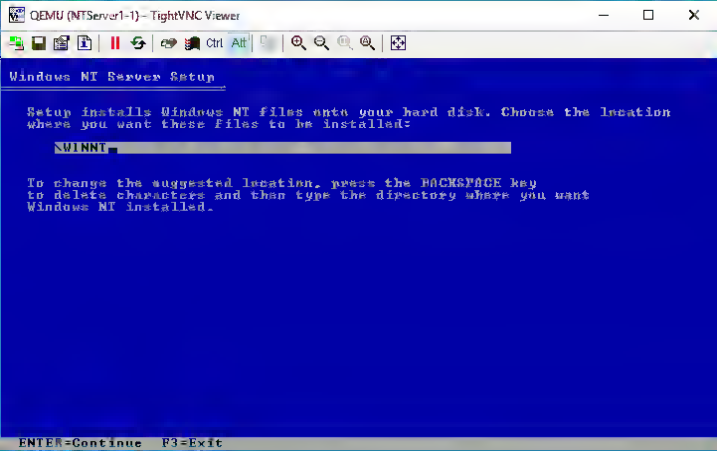

QEMU (NTServer1-1) - TightVNC Viewer
Ctrl
Alt
OS Loader V4.00
Please select the operating system to start
Windows NT Server Version 4.00
Windows NT Server Version 4.00 [VGA mode]
Use ↑ and ↓ to move the highlight to your choice.
Press Enter to choose.
Seconds until highlighted choice will be started automatically: 27

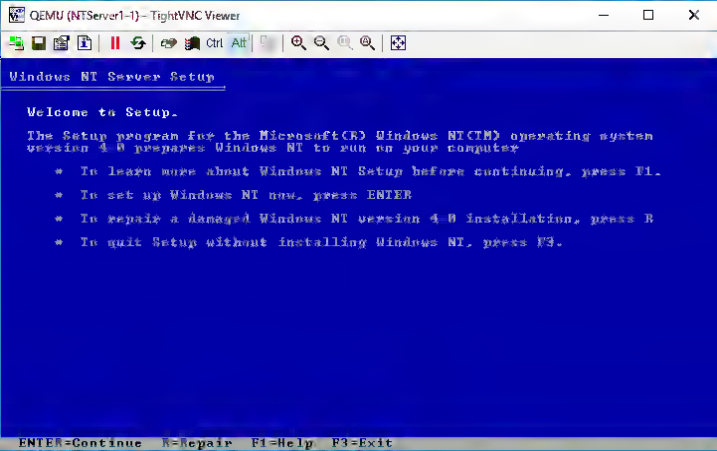

QEMU (NTServer1-1) - TightVNC Viewer
Ctrl
Alt
Windows NT Server Setup
Setup has determined that your computer contains the following hardware
and software components:
Computer: Standard PC
Display: Auto Detect
Keyboard: XT, AT, or Enhanced Keyboard (83-104 keys)
Keyboard Layout: US
Pointing Device: Microsoft Mouse Port Mouse (includes BallPoint)
No Changes:
If you want to change any item in the list, press the UP or DOWN ARROW
key to move the highlight to the item you want to change. Then press
ENTER to see alternatives for that item.
When all the items in the list are correct, move the highlight to
"The above list matches my computer" and press ENTER.
ENTER=Select F3=Exit

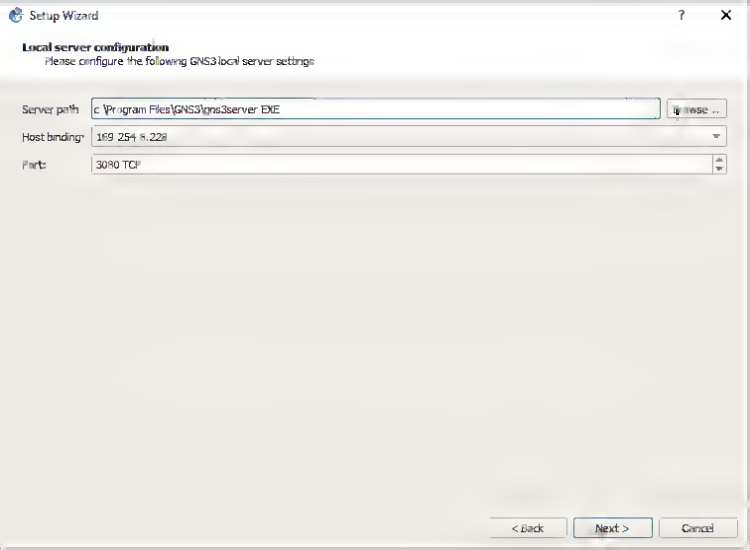

QEMU (NTServer1-1) - TightVNC Viewer
Ctrl
Alt
Windows NT Server Setup
The list below shows existing partitions and spaces available for creating new partitions.
Use the UP and DOWN ARROW keys to move the highlight to an item in the list.
* To install Windows NT on the highlighted partition or unpartitioned space, press ENTER.
* To create a partition in the unpartitioned space, press C.
* To delete the highlighted partition, press D.
500 MB Disk 0 at Id 0 on bus 0 on atapi
Unpartitioned space 500 MB
ENTER=Install C=Create Partition F1=Help F3=Exit

Setup Wizard
Server
Please choose a server type to run your GNS3 network simulations. The GNS3 VM is strongly recommended on Windows and Mac OS X.
Run modern IOS (IOSv or IOU), ASA and appliances from non Cisco manufacturers.
This will require an additional VM (the GNS3 VM is available for free)
Run only legacy IOS on my computer
Requires IOS images <-- C7200
Run everything on a remote server (advanced usage)
The server will be on a remote computer and can be shared with multiple users
Don't show this again

Breakthrough $899 Offer—Now You Can *Drive* CD-ROM

Until December 31, 1989 Compact Disk Products (CDP) is packaging the just released third generation Hitachi CD-ROM drive with Microsoft's most popular CD-ROM software:

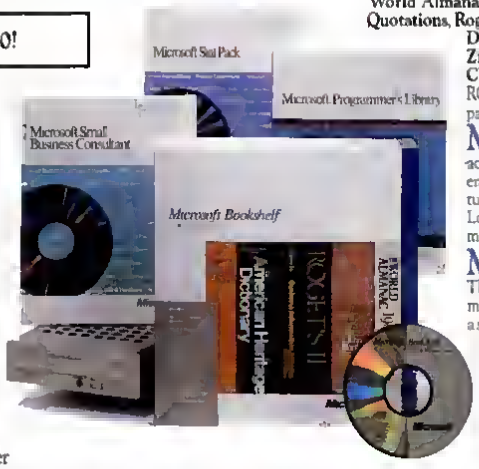

Package A—For $899, includes **Microsoft Bookshelf,** a coupon to purchase both **Microsoft Stat Pack** and **Microsoft Small Business Consultant** for only $50 each, a **FREE** copy of **CD-Play Demo** and **FREE** Federal Express delivery.*

Package B—For $1189 also includes **Microsoft Programmer's Library**

YOU SAVE OVER $670!

Buy CD-ROM now! CDP sells over 200 quality CD-ROM titles for libraries, schools, legal and medical professionals, programmers, and many others. Over 25 new titles are being published each month. With IBM, NEC, and HP announcing new CD-ROM based PC's or Mini's, a CD-ROM drive is becoming as necessary as a floppy drive.

"I believe more than ever that CD-ROM products will be a major force in the expansion of the information industry." **Bill Gates.**

CDP is the largest specialized supplier of CD-ROM products in the U.S. Since 1987, CDP has supplied you with prompt service and expert advice…at the best prices. CDP is committed to CD-ROM and it shows. Our Unconditional Guarantee is unmatched. Our **FREE** Federal Express delivery is an industry first. Call now and tomorrow you will be driving these power CD-ROM products.

CIRCLE R/S #261/DEALERS CIRCLE #523

1) If FOR ANY REASON you are unhappy with your purchase you may return it within 30 days for a FULL REFUND.

2) CDP will extend the Hitachi 90 day warranty period to 180 days and, during the warranty period, will ship replacement drives overnight.

Hitachi CD-ROM drives retail ($995) Hitachi's second generation drives, the 1503 and the 3500, captured over 60% of the market with superior functionality and reliability. The third generation 3600 model (internal or stand-alone) released in September 1989 is Hitachi's powerhouse for the 1990's. Superior speed comes from a look-ahead cache and a linear pickup head motor. Powerful standard features include 8 drive daisy chaining, slim vertical or horizontal mounting, and full audio CD capabilities (accessible with CD Play Demo)

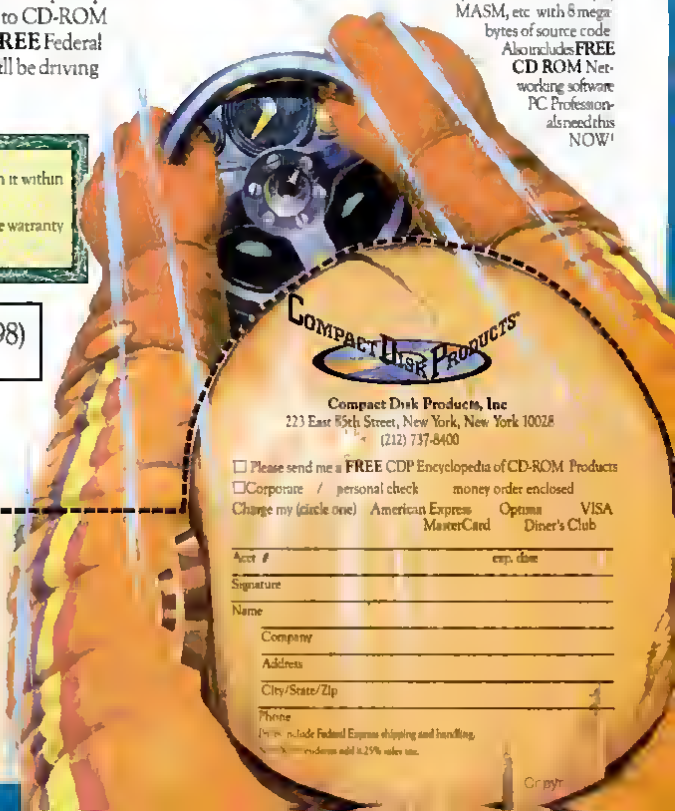

Now! Get CD-Play Demo FREE Use Your CD-ROM Drive as an Audio CD Player!

Microsoft Bookshelf (retail $295) An indispensable collection of writer's references for word processor users. This is the most popular CD ROM title published. You get instant access to. **The World Almanac, Chicago Manual of Style, Bartlett's Familiar Quotations, Roget's II Electronic Thesaurus, American Heritage Dictionary, Business Information Sources, The U.S. Zip Code Directory, Houghton Mifflin Spell Checker and Usage Alert** and more! All Microsoft CD-ROM's are RAM resident and include powerful cut and paste features for popular word processing packages.

Microsoft Stat Pack (retail $125) Now you have easy access to the abundance of statistics published by the Federal Government—census data, business statistics, agricultural surveys and much more, plus Microsoft Excel and Lotus 1-2-3 spreadsheet files for all tables. A must for marketers and planners.

Microsoft Small Business Consultant (retail $149) The most popular publications of the Small Business Administration and Deloitte, Haskins and Sells on running a small business. Answer tax, accounting, legal, personal, AND financing questions in an instant. A gold mine for businessmen, accountants, and consultants.

Microsoft Programmers Library (retail $395) "All the critics are raving." *a masterpiece of simplicity and function* **PC World,** May '89. A complete library (over 20,000 pages) of the latest releases of Microsoft's Technical Reference Manuals covering OS/2, Windows MS-DOS, C, MASM, etc. with 8 megabytes of source code. Also includes **FREE CD ROM** Networking software. PC Professionals need this NOW!

opportunity for a product such as OS/2.
And finally I'd like to thank Bill Gates for creating and captaining one hell of a company, thereby making all this possible
Foreword
OS/2 is destined to be a very important piece of software. During the next 10 years, millions of programmers and users will utilize this system. From time to time they will come across a feature or a limitation and wonder why it's there. The best way for them to understand the overall philosophy of the system will be to read this book. Gordon Letwin is Microsoft's architect for OS/2. In his very clear and sometimes humorous way, Gordon has laid out in this book why he included what he did and why he didn't include other things.
The very first generation of microcomputers were 8 bit machines, such as the Commodore Pet, the TRS 80, the Apple II, and the CPM 80 based machines. Built into almost all of them was Microsoft's BASIC Interpreter. I met Gordon Letwin when I went to visit Heath's personal computer group (now part of Zenith). Gordon had written his own BASIC as well as an

THE NEW COMPUTERS FROM AT&T. FLEXIBLE. RELIABLE. AND VERY COMPATIBLE.

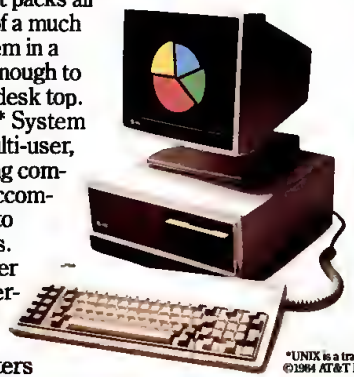

They're new in every sense of the word. New in conception, new in design, new in their ability to deliver unprecedented levels of computer performance. After over 40 years of designing and manufacturing computers, AT&T is proud to introduce a whole new line of innovative computers for business...AT&T Computers.

MEET THE FAMILY

The 3B2, 3B5, and the AT&T Personal Computer make up the new AT&T family of flexible business computers.

The AT&T 3B2 is one of the most advanced super microcomputers you can buy today. It packs all the power of a much larger system in a size small enough to sit on your desk top. This UNIX* System V-based multi-user, multi-tasking computer can accommodate up to 18 terminals.

For larger family gatherings, the AT&T 3B5 minicomputers make great hosts, because they can accommodate up to 60 users.

And meet the new AT&T Personal Computer. What makes it special is its ability to combine high performance with excellent

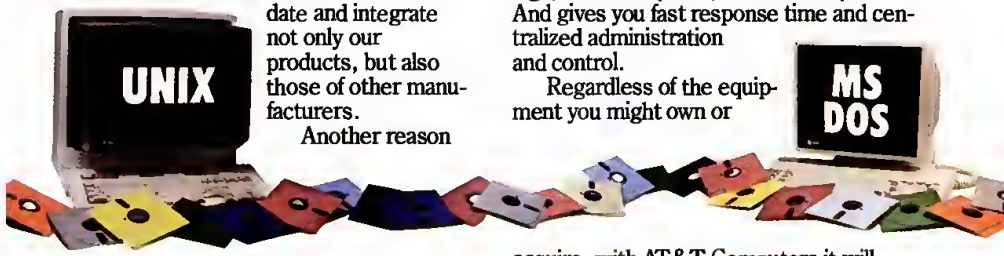

UNIX SYSTEM V

graphics capabilities, an adjustable display monitor, and non-glare screen. Its flexibility allows it to operate as a stand-alone unit or as part of an integrated computer network. And its compatibility allows it to run most popular business software, including most available MS-DOS** applications.

THE FAMILY THAT WORKS TOGETHER

One big advantage of AT&T Computers is that when there's work to be done, everyone pitches in.

Each family member works together in a coordinated system, making tasks easier and users more productive. All AT&T Computers are based on our Information Systems Architecture, an open, communications-based structure that can accommodate and integrate not only our products, but also those of other manufacturers.

Another reason AT&T family members work so well together is our unique PC Interface. It bridges the MS-DOS and UNIX Operating Systems, allowing you to use your PC as part of a larger 3B network. Several PC users can thus share peripherals and files stored on the central 3B2 machine.

Yet another reason AT&T Computers are such a close-knit family is our UNIX System V Operating System, developed by AT&T Bell Laboratories. It's an operating system so flexible, it's rapidly becoming an industry standard. And because UNIX software is upwardly compatible, 3B2 software can run on 3B5 computers, thus protecting your investment and eliminating costly and time-consuming retraining.

THEY GET ALONG FAMOUSLY WITH MOST EVERYONE

AT&T Computers get along so well with each other, they can't help but get along with just about everyone else. The AT&T Information Systems Network links AT&T Computers with those of other manufacturers. It's a flexible, cost-efficient link between terminals, workstations, and computers of all sizes. This local area network allows you to connect departments, buildings, industrial parks, or even campuses. And gives you fast response time and centralized administration and control.

Regardless of the equipment you might own or acquire, with AT&T Computers it will be like one big happy family.

BUILT-IN RELIABILITY AND SERVICE

Judging by the way they're made and cared for, this family will be around for generations. AT&T Computers meet the toughest design standards and most rigorous testing procedures.

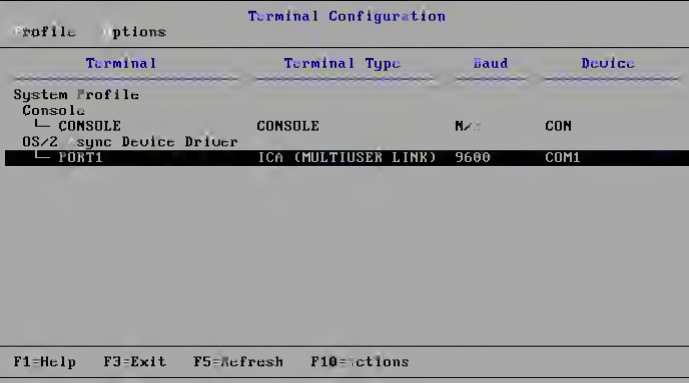

And should you ever require service, we offer around-the-clock maintenance, and one of the industry's largest service forces.

For more information call your AT&T Information Systems Account Executive or 1 (800) 247-1212. Then make arrangements to meet the family: the 3B2, 3B5 and the AT&T Personal Computer. When it comes to meeting your needs, AT&T Computers couldn't be more compatible.

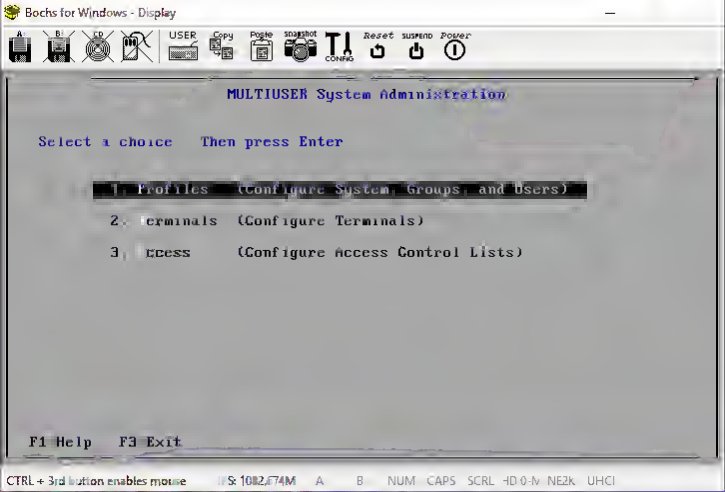

AT&T INFORMATION SYSTEMS. WHEN YOU'VE GOT TO BE RIGHT.

AT&T

Introducing Citrix *MULTIUSER*™: Now, for low-cost multiuser computing, OS/2® means business.

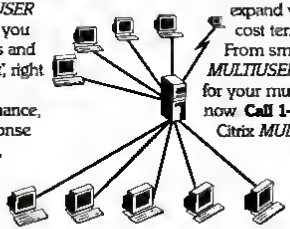

> *"You want low cost per seat, central control, simple installation and administration, and rock-solid stability. That's what Citrix has to offer."*
>
> *Jon Udell*
> *Byte Magazine*
> *January, 1991*

Multiply the benefits of DOS and OS/2 without multiplying the cost.

Citrix *MULTIUSER* introduces the power of OS/2® to the world of multiuser business computing. For both custom and shrink-wrapped applications, it delivers OS/2 capabilities to your system at minimal cost per user. *MULTIUSER* includes industry standard Microsoft OS/2, so you can run all text-based OS/2 development tools and applications, like Lotus 1-2-3® and Word Perfect®, right out of the box.

Delivering outstanding speed and performance, *MULTIUSER* makes your terminal screen response as fast as a dedicated PC. And since it is OS/2, *MULTIUSER* provides the familiar DOS®-like environment, with no retraining required.

You also get SAA compliance in a system with true commercial-grade reliability and security. *MULTIUSER* offers a full set of CUA-compliant system management and administration utilities. What's more, *MULTIUSER* is LAN compatible, letting you expand your network by simply adding low-cost terminals.

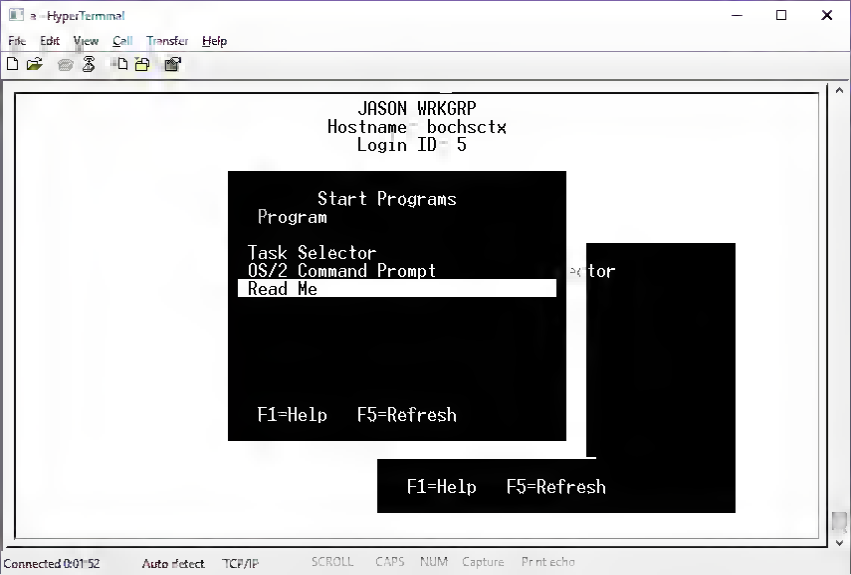

From small businesses to large corporations, *MULTIUSER* is the operating system that's right for your multiuser needs. And it's available right now. **Call 1-800-437-7503** to see how Citrix *MULTIUSER* can mean business for you.

Can Your Business Solutions Easily Adapt To Change?

Introducing Citrix MULTIUSER 2.0.

Connecting Multiple DOS, Windows Or OS/2 Users With Your Solutions Is Now Simple.

Your customers know exactly what they want.

Unfortunately they don't all want the same thing. So you need to offer a solution that's adaptable to any customer's requirement — be it DOS Windows or OS/2 applications — without modification.

It also makes good business sense to provide a solution that's rock-solid reliable and easy to maintain. And equally important, is adaptable to new technology.

You can offer this solution to your customers now, quickly and easily with MULTIUSER 2.0.

The Last Word In Industry Standards.

MULTIUSER 2.0 will let your customers take advantage of thousands of shrink-wrapped products right out of the box...by integrating the binary industry standards of DOS Windows and OS/2.

For you...it means the opportunity to advance with the industry and no longer worry about being locked into a proprietary environment.

Higher Productivity Without Higher Costs.

With MULTIUSER 2.0 your customers can now use inexpensive personal computers or low cost terminals to access the full power of the most advanced 386/486 systems.

This allows you to deliver just the right mix of hardware, software, and peripherals for superior cost effective solutions.

Better yet with our complementary LINK products existing low performance 286 or even 8086 equipment become high performance workstations.

All of which adds up to a solution that not only works better, but at a much lower cost per user.

Any popular DOS, Windows or OS/2 application will run and run better in MULTIUSER 2.0.

Power Without Complexity Means Ease of Use.

Simple installation procedures user friendly configuration utilities and administration menus make on-going production operation a snap. You just have to set up one machine and all your users will be up and running immediately.

All of the 32-bit multitasking multiuser,

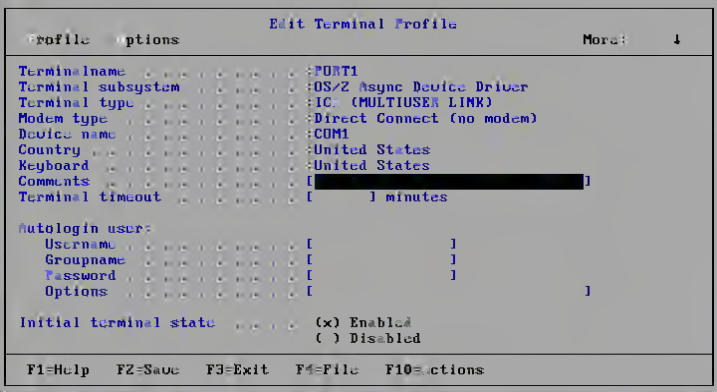

> *"The Citrix products provide outstanding performance and are unique in their efficient support for remote (application) execution. The combination of NACS v3.0 for managing remote communications and Citrix for decentralizing mission critical applications is something our customers have been demanding."*
>
> *Gerry Mechl*
> *V.P. and General Manager, Novell*

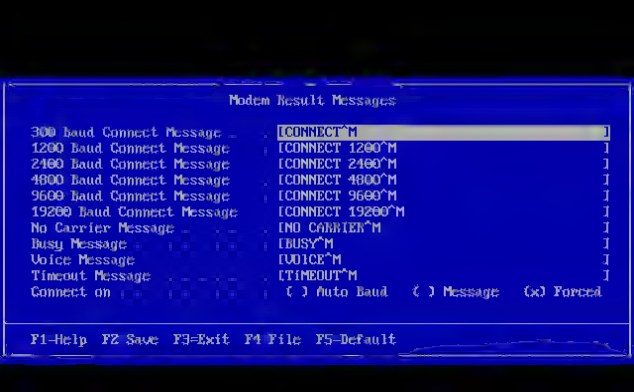

real-time computing power of MULTIUSER 2.0 comes to you on only six diskettes.

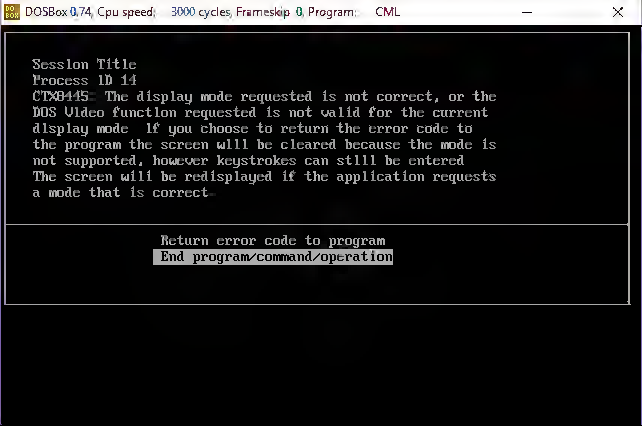

A Solution Your Users Already Know How To Use.

Your DOS, Windows or OS/2 users will be delighted to know that no retraining is necessary with MULTIUSER 2.0.

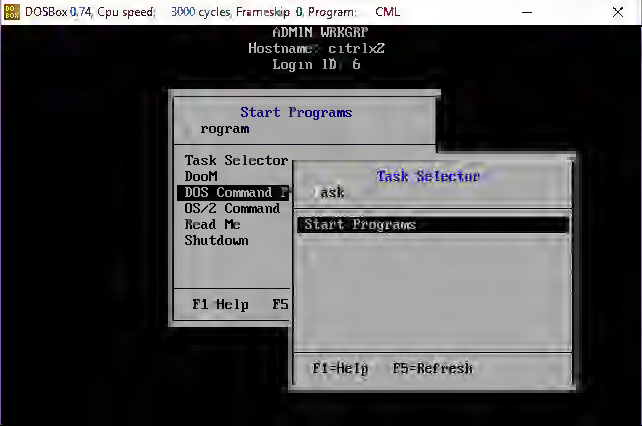

And that they will be able to run their applications in a more powerful environment without

Microsoft Game Shop

Welcome to the Microsoft Game Shop. Take a look around. You'll find games like the QBasic penguin demo, the language tutorial *Learn BASIC Now*, the book selling book about learning to program in BASIC

Let the games begin!
The Microsoft Game Shop includes
- *QSpace*. Defend your space station from enemy attack
- *QBlock*. Play paddle ball with a twist
- *QSynth*. Turn your computer into a musical instrument
- *QMaze*. Escape the maze before a monster can be you!
- *QShips*. Fight a duel on the high seas
- And more!

Cut yourself in on the action.
You're in complete control of the Microsoft Game Shop's QBasic games. You can play them right out of the box *and* you can change them yourself by following simple step-by-step instructions. Want to change the scoring system in QSpace? Want to add colorful special effects to QSynth? Go for it! It's a fun way to learn basic programming concepts

Take a look behind the scenes.
Step into the back room of the Game Shop and meet QBasic, a complete programming language. Want to learn more? Open up the enclosed copy of *Learn BASIC Now*. This easy-to-follow book can take you from BASIC novice to lean, mean, pro gramming machine

There's a place in this world for DOS and Windows.

And you're looking at it.

OS/2® 2.0 isn't about leaving your DOS and Windows™ applications behind. It's about moving them ahead—doing more with them than ever before.

Now you can run DOS, Windows and OS/2 applications at the same time, in separate windows on the same screen. Create a new letter while using your fax/modem. Print charts as you calculate a complex spreadsheet. Even "cut and paste" between *any* applications—and more. But OS/2 doesn't just enhance your current applications. It protects your investment in them. And preserves your choices as more become available, including new 32-bit applications.

But maybe the best part is that for less than the cost of DOS and Windows, you get the capabilities of both. Plus all the added benefits of OS/2 2.0—including Adobe Type Manager™ So with OS/2 2.0, whatever applications you use, you've come to the right place. For an IBM authorized dealer near you, or to order OS/2 2.0 from IBM—at special introductory prices of $49 for Windows users and $99 from any DOS—call 1 800 3-IBM-OS2*

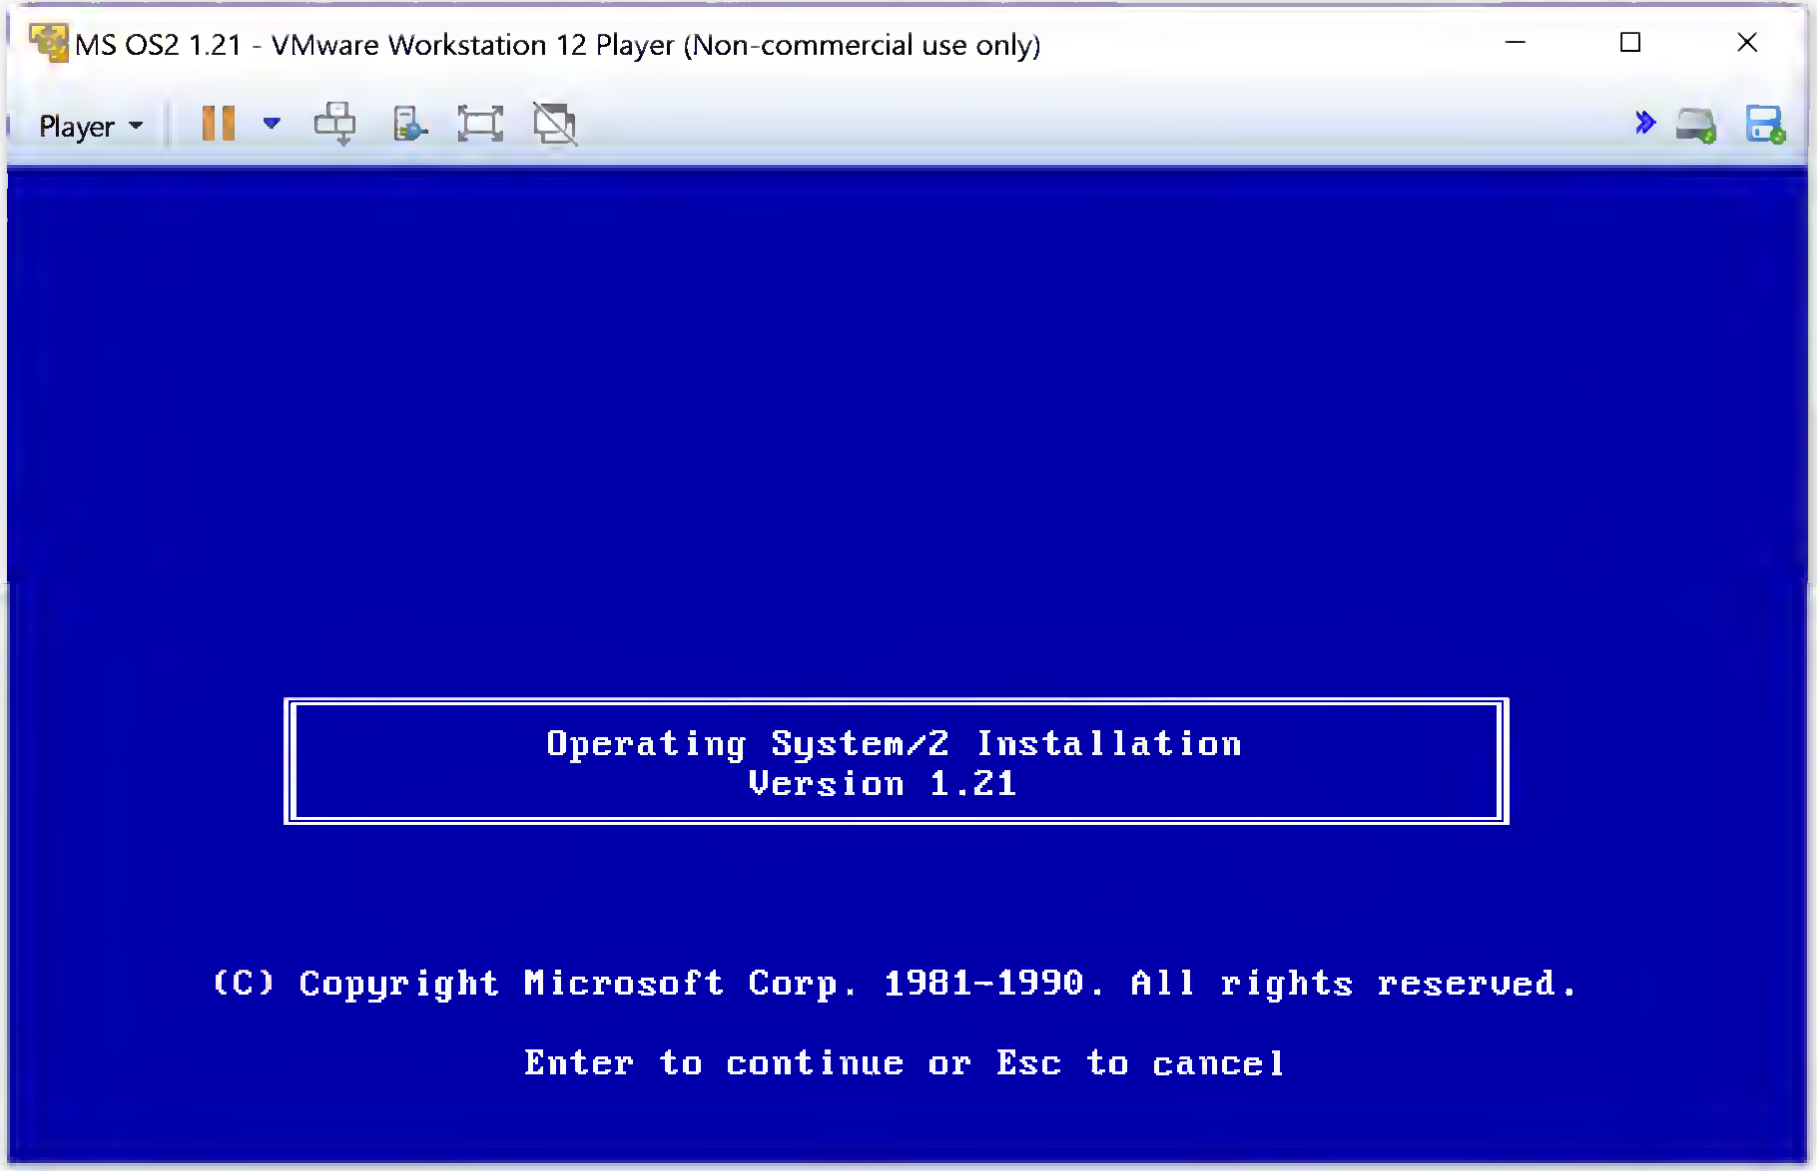

Introducing OS/2 2.0.

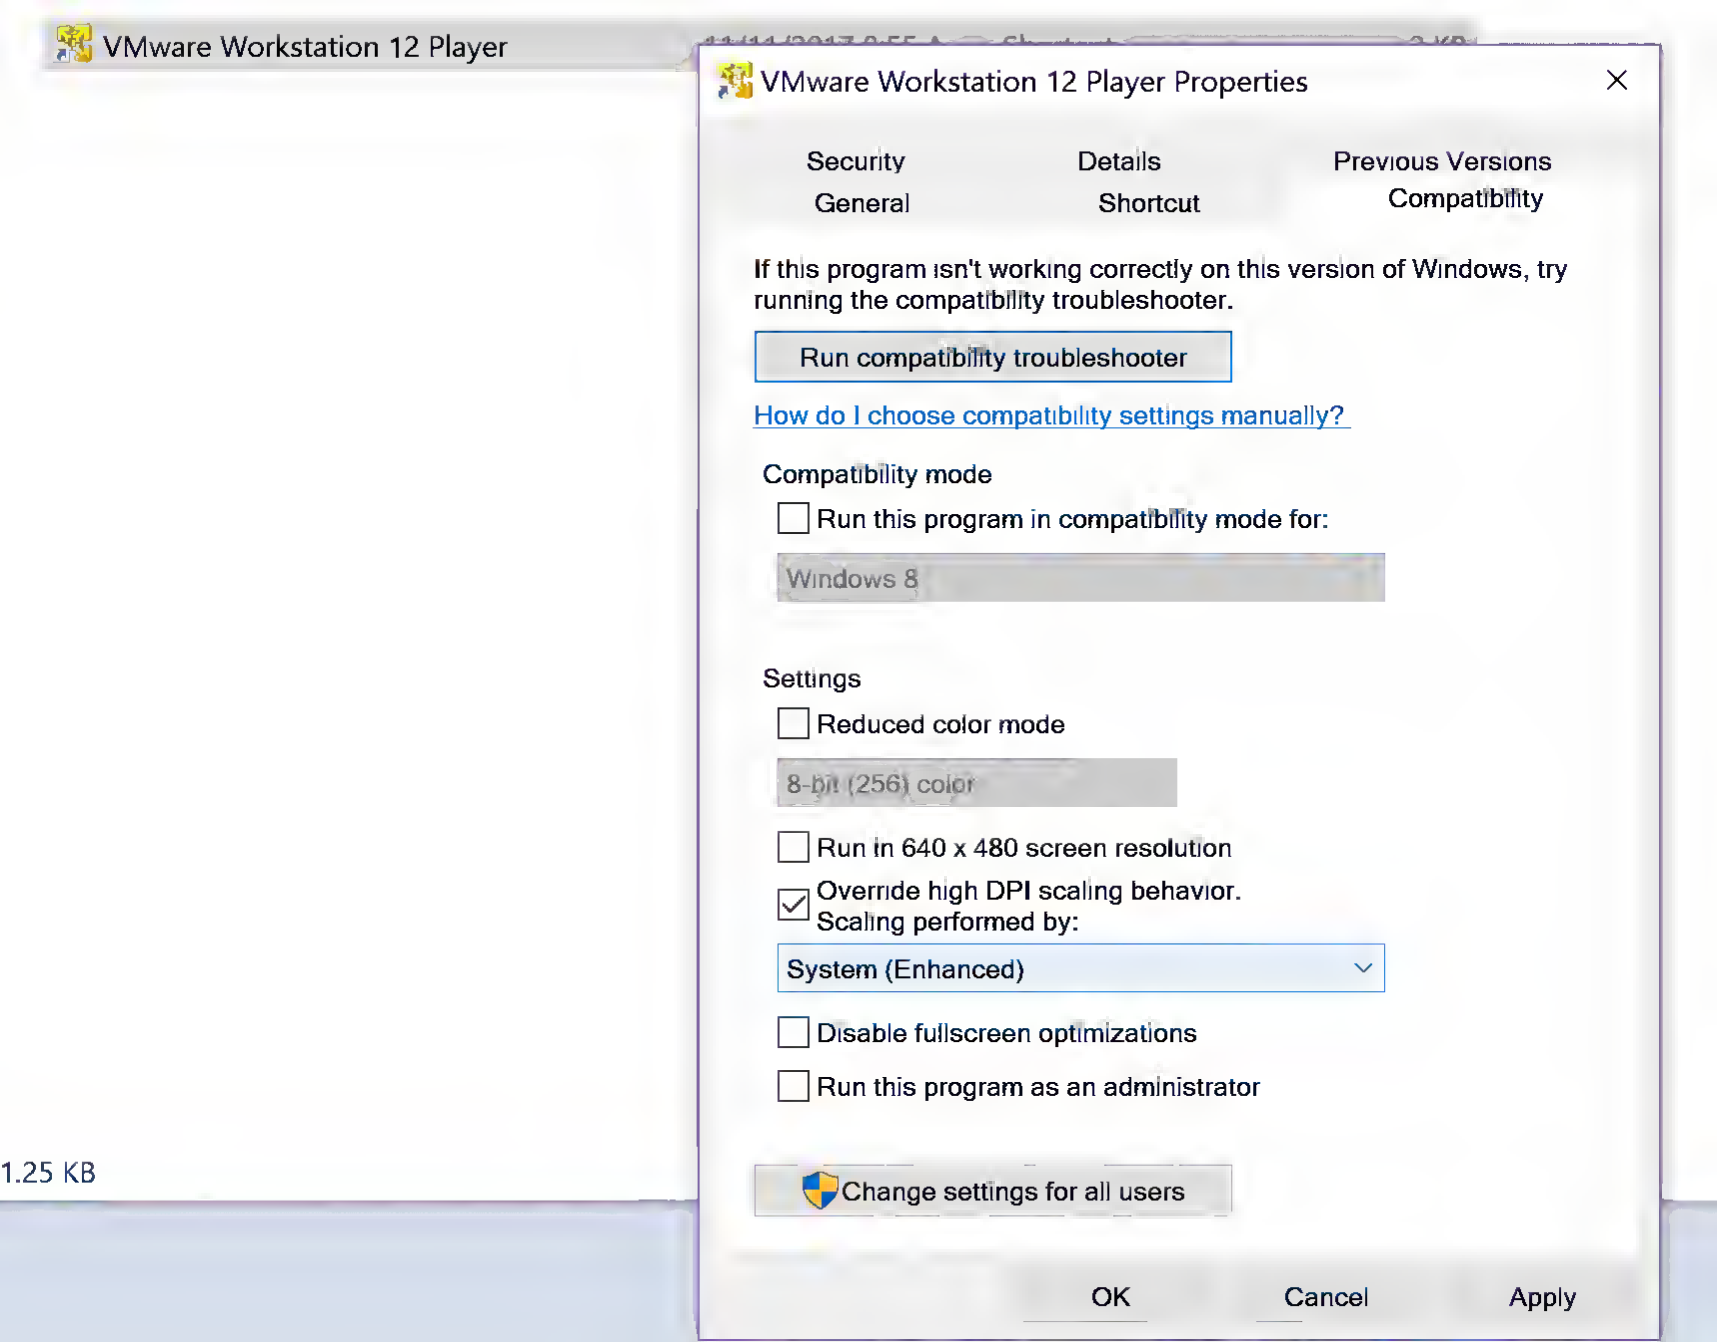

- *Runs DOS, Windows and OS/2 applications from a single system.*
- *Supported on most IBM-compatible 386 SX PCs and above*
- *Up to 448MB expanded memory per application. No 640K limit.*
- *Workplace Shell™ an easy-to-use graphical interface*
- *OS/2 2.0 upgrade $49 from Windows, $99 from any DOS***

Revisiting a Solaris on Qemu install

3

Posted on December 6, 2017 by neozeed

Since I had written about it the last time, quite a bit of the emulation on Qemu has improved significantly since then. As always you'll need to create and prepare a boot image and I'm using an old SUN Station 5 PROM.

```
qemu-system-sparc -L . -m 64 -M SS-5 -bios ss5.bin -drive
file=36G.disk,bus=0,unit=0,media=disk,drive
```

Calamus®
INTEGRATED PUBLISHING

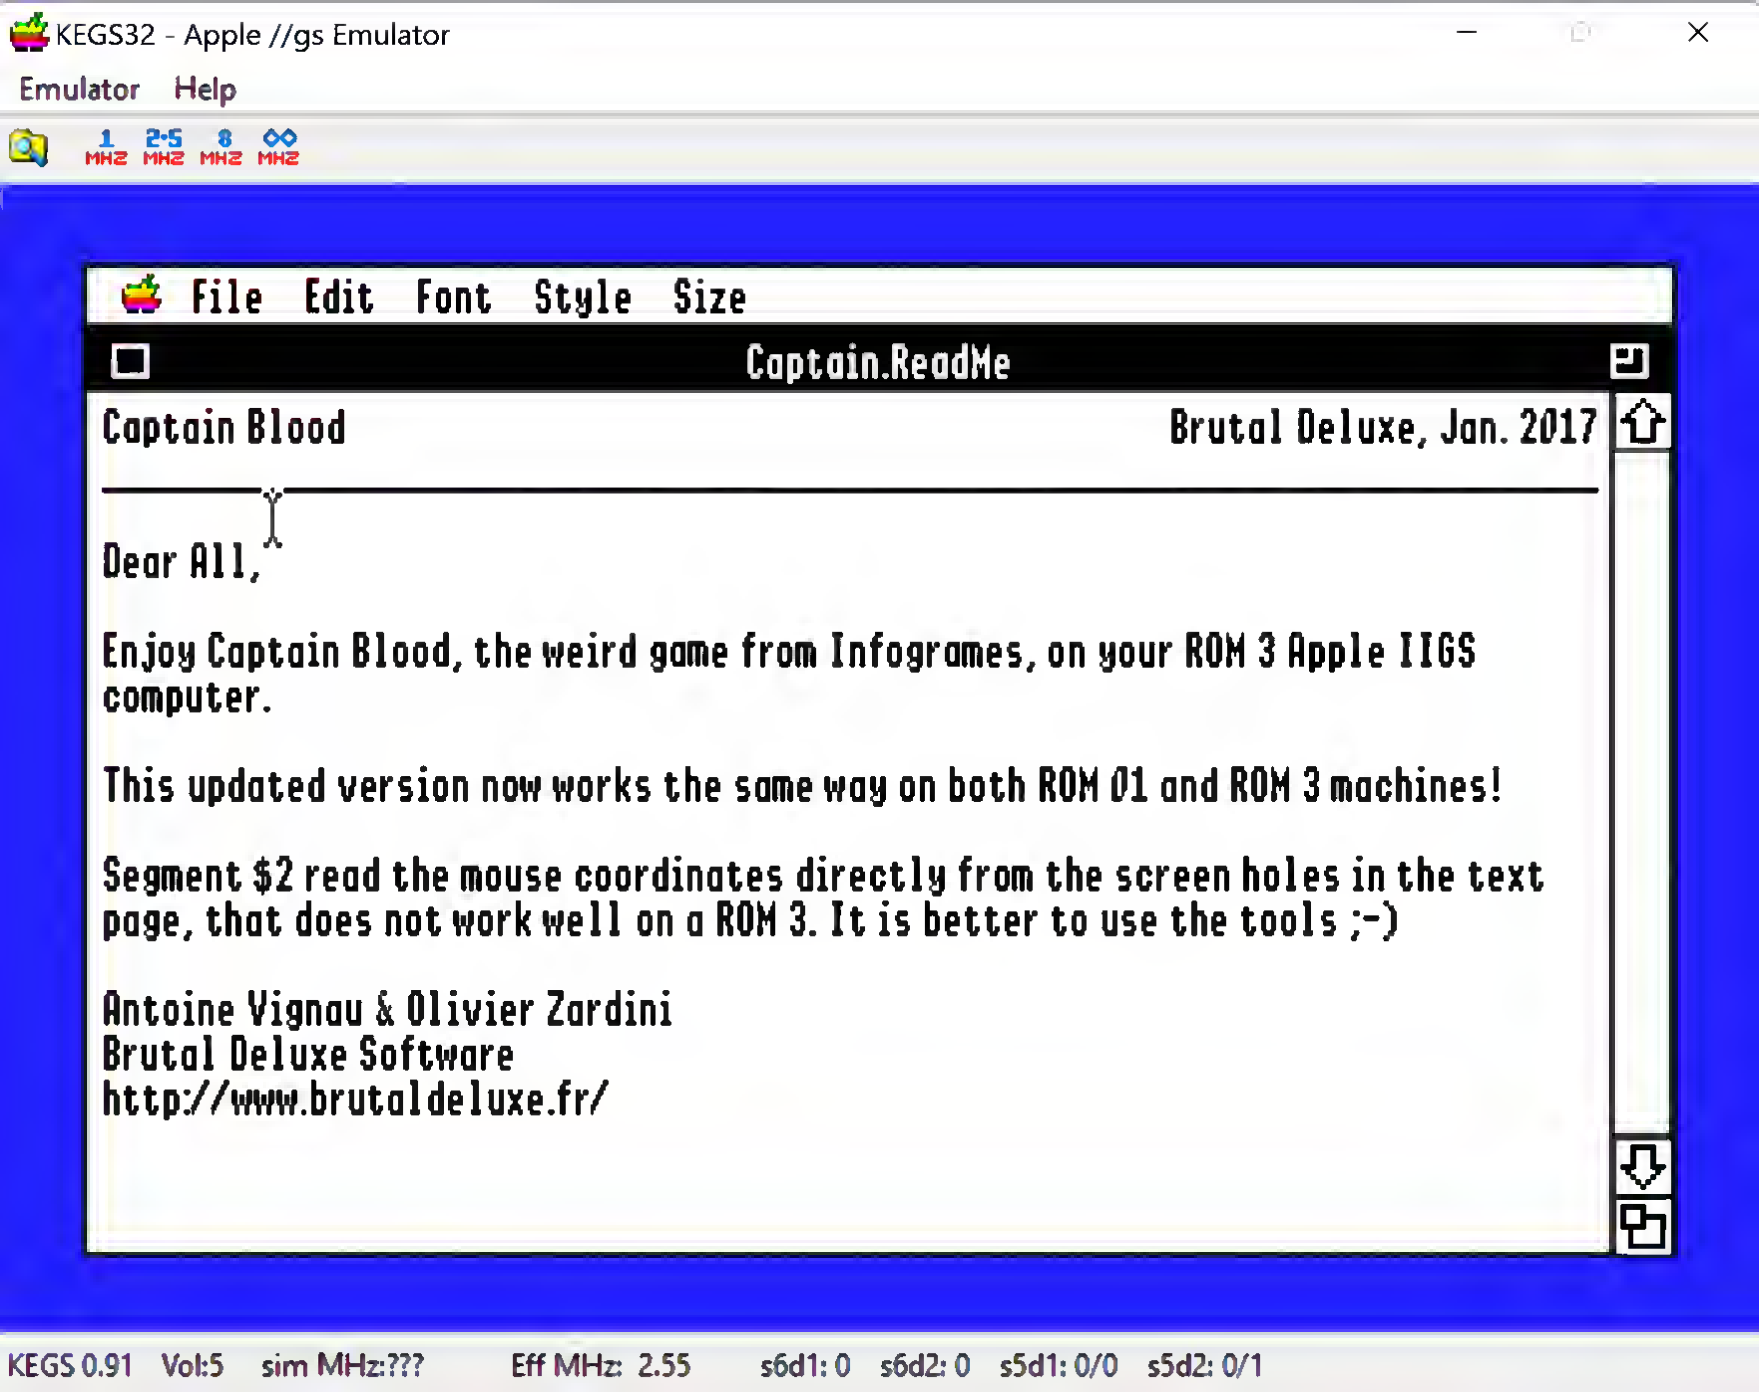

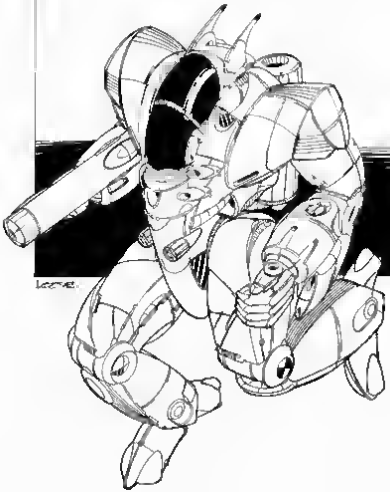

Calamus for Windows NT(tm) supports multiple hardware platforms. In order to install Calamus® for your machine type, please select your CPU type from the list above.

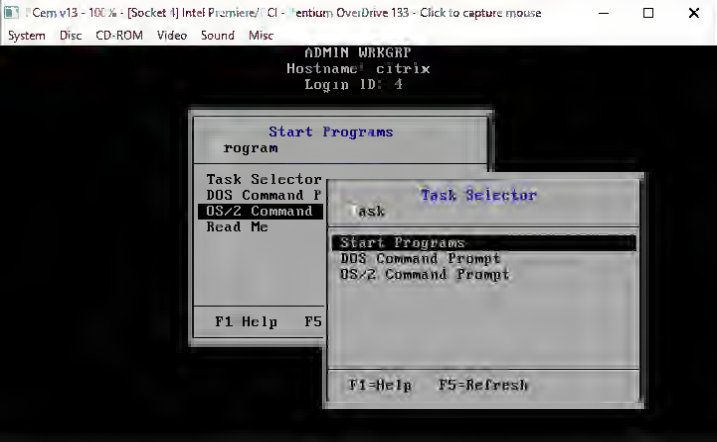

For owners of an Intel Pentium(tm) machine, we have included a special version of Calamus® for Windows NT(tm) which uses Pentium(tm) optimized code. This version will ONLY run on Pentium(tm) processors, but will be 20-30 percent faster than the Intel 486(tm) version running on the same Pentium(tm) processor.

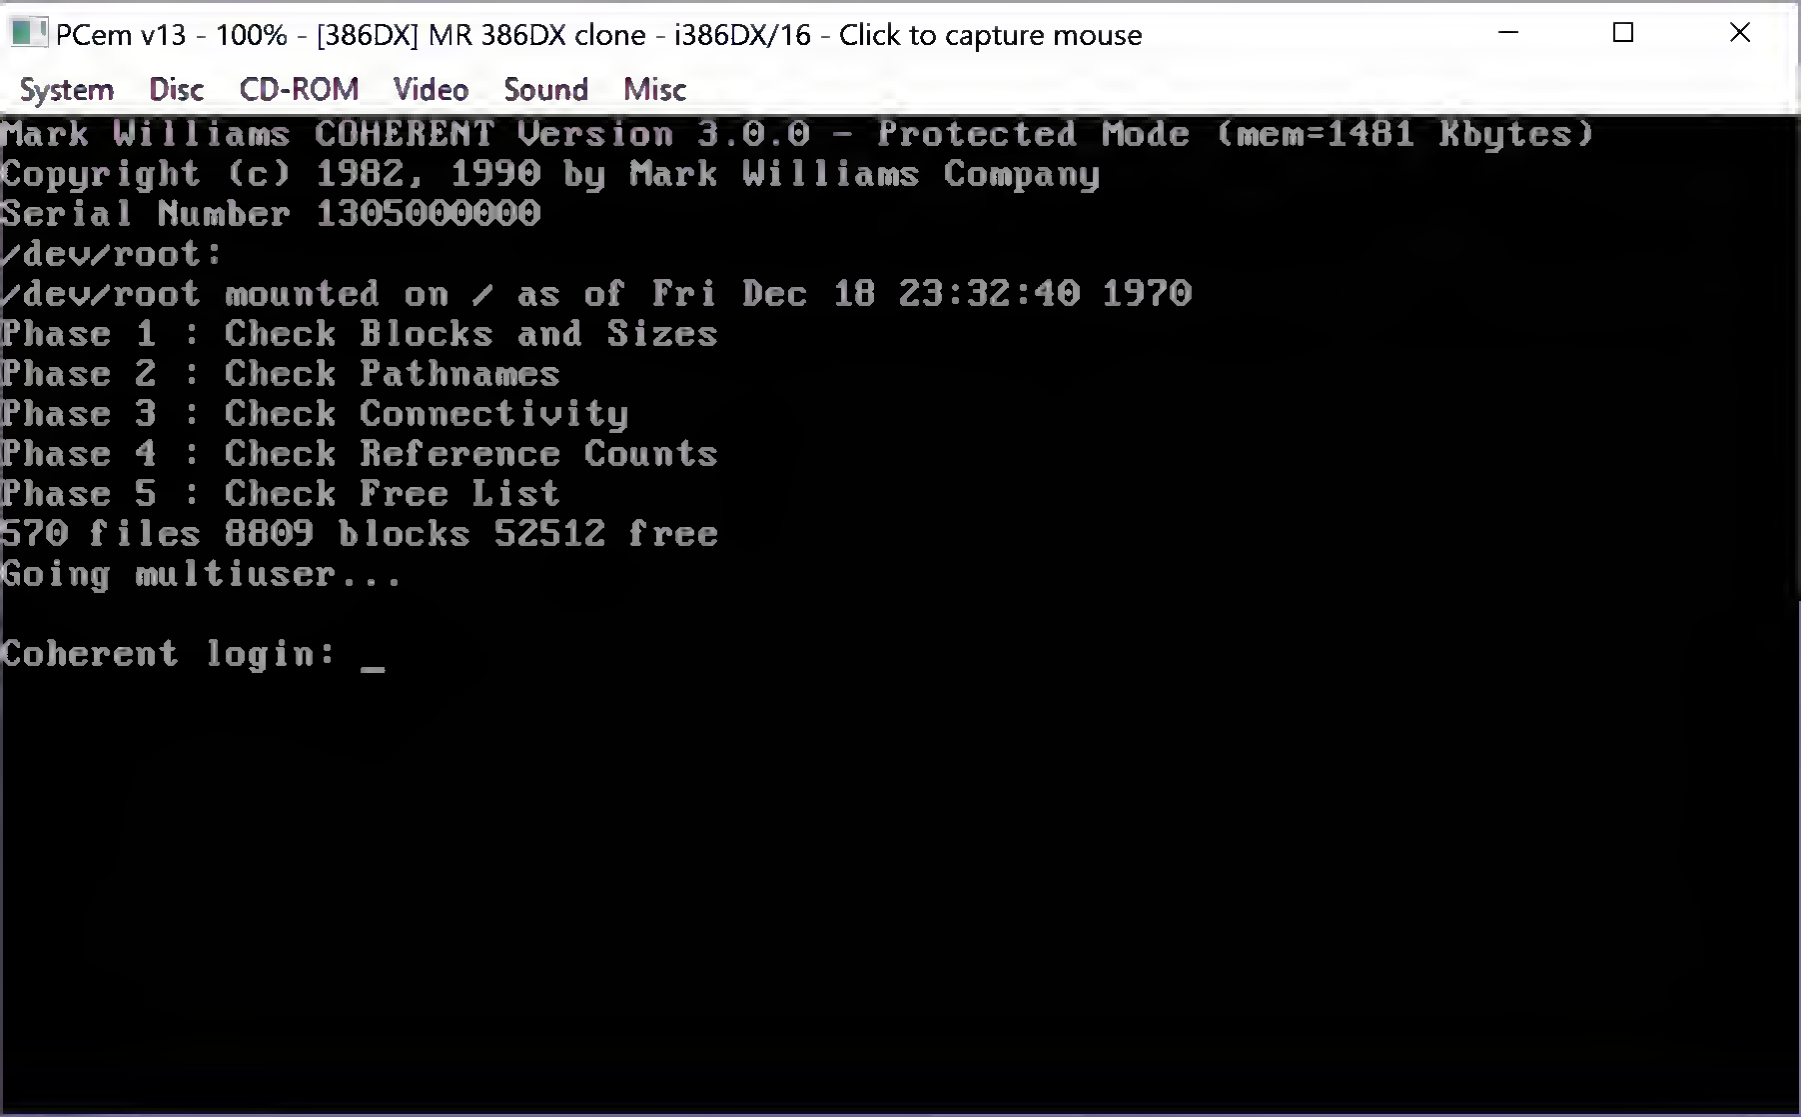

Click the "DEMO" box if you want to install a DEMO version of Calamus®

Captain Blood
Brutal Deluxe, Jan. 2017
Dear All,
Enjoy Captain Blood, the weird game from Infogrames, on your ROM 3 Apple IIGS computer.
This updated version now works the same way on both ROM 01 and ROM 3 machines!
Segment $2 read the mouse coordinates directly from the screen holes in the text page, that does not work well on a ROM 3. It is better to use the tools ;-)

Everything You Ever Wanted In UNIX. And Less. $99.95.*

OK. We know it's hard to believe. So just consider this. Coherent™ is a virtual clone of UNIX. But it was developed independently by Mark Williams Company. Which means we don't pay bundreds of dollars per copy in licensing fees.

What's more, Coberent embodies the original tenet of UNIX: small is beautiful. This simple fact leads to a whole host of both cost and performance advantages for Coherent. So read on, because there's a lot more to Coherent than its price.

SMALLER, FASTER...BETTER.

Everybody appreciates a good deal. But what is it that makes small so great?

For one thing, Coherent gives you UNIX capabilities on a machine you can actually afford. Requiring only 10 megabytes of disk space,

LESS IS MORE!	Coherent For the IBM-PC/AT and compatible 286 or 386 based machines.	Santa Cruz Operation's XENIX 286, Version 2.3.2
No. of Manuals	1	8
No. of Disks	4	21
Kernel Size	64K	198K
Install Time	20-30 min.	3-4 hours
Suggested Disk Space	10 meg	30 meg
Min. Memory Required	640K	1-2 meg
Performance*	38.7 sec	100.3 sec
Price	$99.95	$1495.00

*Byte Exed benchmark, 1000 iterations on 20 MHZ 386.
Hardware requirements: 1.2 meg 5¼" or 1.4 meg 3½" floppy and hard disk. SCSI device driver available soon. Does not run on Microchannel machines.

Coherent can reside with DOS. So you can keep all your DOS applications and move up to Coherent. You can also have it running faster, learn it faster and get faster overall performance. All because Coherent is small. Sounds beautiful, doesn't it?

But small wouldn't be so great if it didn't do the job it was meant to do.

EVERYTHING UNIX WAS MEANT TO DO.

Like the original UNIX, Coherent is a powerful multi-user, multi-tasking development system. With a complete UNIX-compatible kernel which makes a vast world of UNIX software available including over a gigabyte of public domain software.

Coherent also comes with Lex and Yacc, a complete C compiler and a full set of nearly 200 UNIX commands including text processing, program development, administrative and maintenance commands.

And with UUCP, the UNIX to UNIX Communication Program that connects you to a world-wide network of free software, news and millions of users. All for the cost of a phone call.

We could go on, but stop we must to get in a few more very important points.

EXPERIENCE, SUPPORT AND GUARANTEES.

Wondering bow something as good as Coherent could come from nowhere? Well it didn't. It came from Mark Williams Company, people who've developed C compilers for DEC, Intel, Wang and thousands of professional programmers.

We make all this experience available to users through complete technical support via telephone. And from the original system developers, too!

Yes, we know $99.95 may still be hard to believe. But we've made it fool-proof to find out for yourself. With a 60-day money-back no-hassles guarantee.

You have to be more than just a little curious about Coherent by now. So why not just do it? Pick up that pbone and order today.

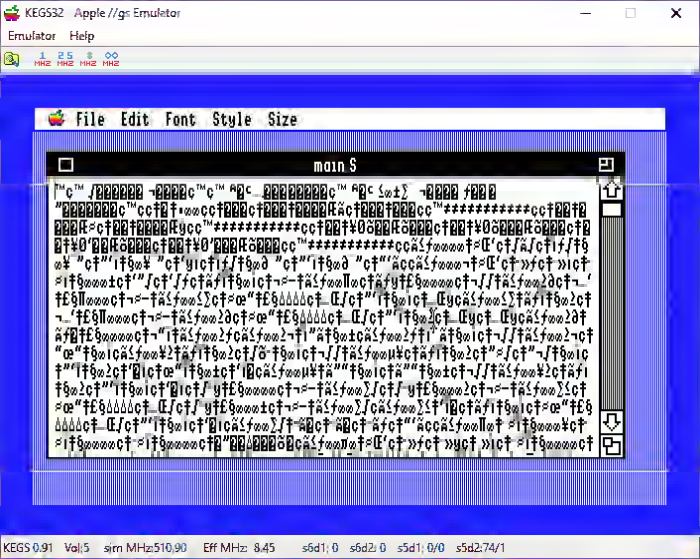

You'll be on your way to having everything you ever wanted in UNIX. And for a lot less than you ever expected.

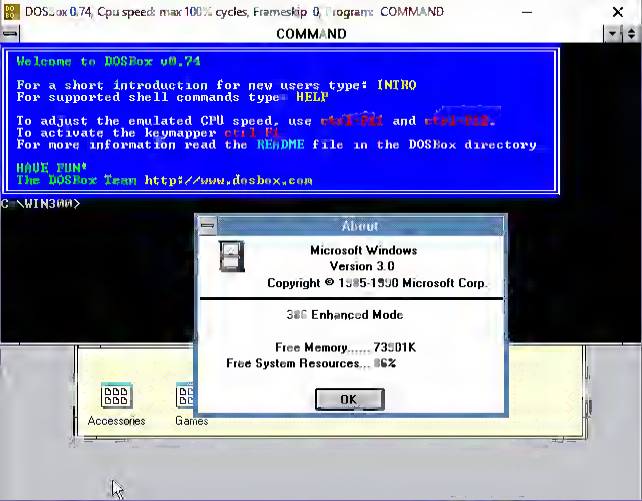

1-800-MARK WMS

Help

Greetings SimCity Mayor:

Introducing an easier way to run, manage and expand your city. SimCity® for Windows™! I hope it brings you hours of enjoyable city planning (or destroying).

In spite of our relentless testing on every computer we can get our hands on, we may have overlooked a bug or two.

If you find a bug in SimCity for Windows, let us know. Send us a card or a letter describing the problem. Be as specific as possible, so we can track it down and squash it. Please include your phone number in case we need more info. In addition, please tell us about your computer: the make and model, amount of RAM, DOS version, Windows setup, etc.

Send it to:
Maxis
2 Theatre Square
Suite 230
Orinda, CA 94563-3346
Attn: Yuck! Bugs in the Windows!
or call:
510/254-9700

Once we have the bug licked (and our teeth brushed), we'll send you the new version of SimCity for Windows. If you are the first one to report a real, repeatable bug that is our fault (not just an incompatibility with a memory-resident program), we'll send you a prize.

We're talking bugs now, not wish-lists of features and functions and improvements to add to the program—what the heck, send us your wish-lists, too. If you can think of a way to make this product better in any way, send it in a card or a letter to the above address, Attention: SimSuggestions.

If your suggestion is good enough, we just may send you another prize!

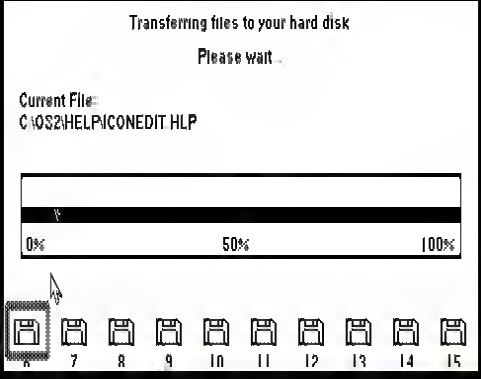

Simcerely,

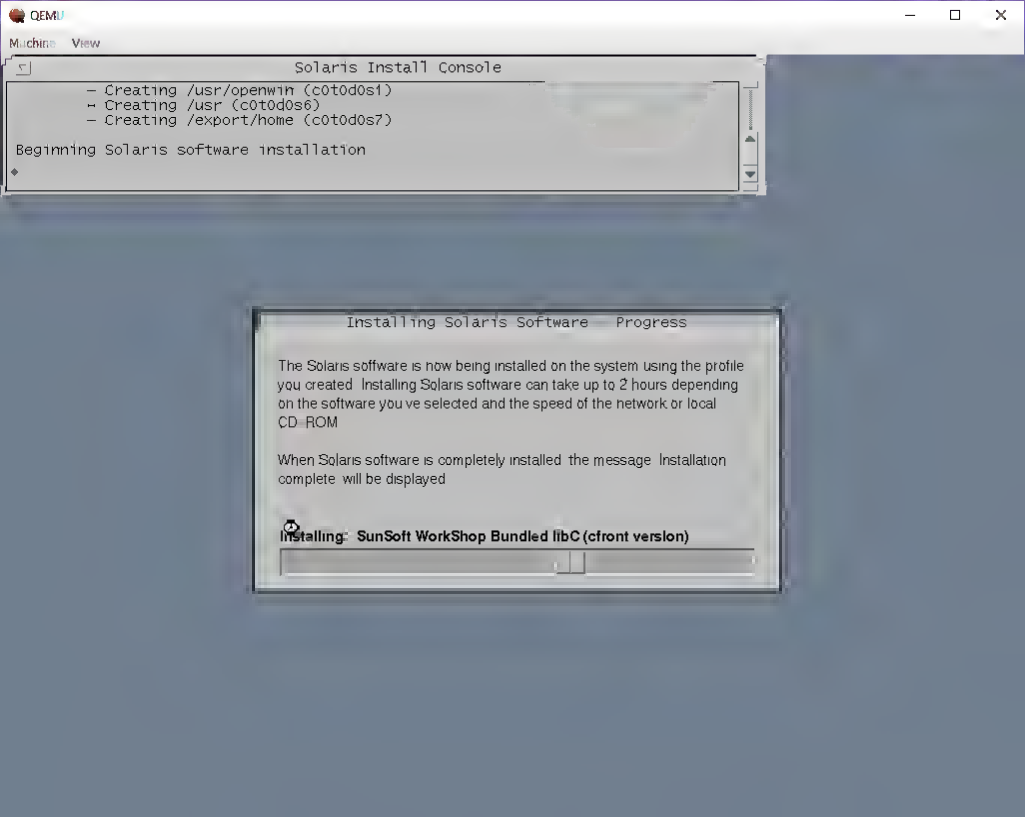

Jeff Braun, President

MAXIS

P.S. Be sure to send in your registration card. It's worth it. Trust me.

We've entered that time between Christmas and New Year's where you don't know what day it is, who you are, or what you're supposed to be doing.

LEARN — Computer-Aided Instruction on UNIX
(Second Edition) Brian W. Kernighan Michael E. Lesk CAI This paper describes the second version of the learn program for interpreting CAI scripts on the operating system, and a set of scripts that provide a computerized introduction to the system. Six current scripts cover basic commands and file handling, the editor, additional file handling commands, the eqn program for mathematical typing, the "-ms" package of formatting macros, and an introduction to the C programming language. These scripts now include a total of about 530 lessons. Many users from a wide variety of backgrounds have used to acquire basic UNIX skills. Most usage involves the first two scripts, an introduction to files and commands, and the editor. The second version of is about four times faster than the previous one in CPU utilization, and much faster in perceived time because of better overlap of computing and printing. It also requires less file space than the first version. Many of the lessons have been revised, new material has been added to reflect changes and enhancements in itself. Script-writing is also easier because of revisions to the script language. Educational Assumptions and Design First, the way to teach people how to do something is to have them do it. Scripts should not contain long pieces of explanation, they should instead frequently ask the student to do some task. So teaching is always by example: the typical script fragment shows a small example of some technique and then asks the user to either repeat that example or produce a variation on it. All are intended to be easy enough that most students will get most questions right, reinforcing the desired behavior. Most lessons fall into one of three types. The simplest presents a lesson and asks for a yes or no answer to a question. The student is given a chance to experiment before replying. The script checks for the correct reply. Problems of this form are sparingly used. The second type asks for a word or number as an answer. For example a lesson on files might say How many files are there in the current directory? Type "answer N", where N is the number of files. The student is expected to respond (perhaps after experimenting) with answer 17 or whatever. Surprisingly often, however, the idea of a substitutable argument (i.e., replacing N by 17) is difficult for new programmer students, so the first few such lessons need real care. The third type of lesson is open-ended — a task is set for the student, appropriate parts of the input or output are monitored, and the student types *ready* when the task is done. Figure 1 shows a sample dialog that illustrates the last of these, using two lessons about the (concatenate, i.e., print) command taken from early in the script that teaches file handling. Most lessons are of this form. box center; c. T| Figure 1: Sample dialog from basic files script

(Student responses in italics; $ is the prompt)

A file can be printed on your terminal
by using the "cat" command. Just say
"cat file", where "file" is the file name.
For example, there is a file named
"food" in this directory. List it
by saying "cat food", then type "ready".
$ *cat food*
this is the file
named food

CAI

ABSTRACT

This paper describes the second version of the *learn* program for interpreting CAI scripts on the UNIX® operating system and a set of scripts that provide a computerized introduction to the system.

Six current scripts cover basic commands and file handling, the editor, additional file handling commands, the *eqn* program for mathematical typing, the "ms" package of formatting macros, and an introduction to the C programming language. These scripts now include a total of about 330 lessons.

Many users from a wide variety of backgrounds have used *learn* to acquire basic UNIX skills. Most usage involves the first two scripts, an introduction to UNIX files and commands, and the UNIX editor.

The second version of *learn* is about four times faster than the previous one in CPU utilization, and much faster in perceived time because of better overlap of computing and printing. It also requires less file space than the first version. Many of the lessons have been revised, new material has been added to reflect changes and enhancements in UNIX itself. Script-writing is also easier because of revisions to the script language.

6. Acknowledgments

We are grateful to all those who have tried *learn*, for we have benefited greatly from their suggestions and criticisms. In particular, M. E. Bittrich, J. L. Blue, S. I. Feldman, P. A. Fox, and M. J. McAlpin have provided substantial feedback. Conversations with E. Z. Rothkopf also provided many of the ideas in the system. We are also indebted to Don Jackowski for serving as a guinea pig for the second version, and to Tom Plum for his efforts to improve the C script.

Ultimate Doom

THE ULTIMATE DOOM

The original game that set the world afire

The complete re-gahlit game that set the world afire. Plus All-New Episode IV Thy Flesh Consumed. The demons came and the marines died. Except one. You are the last defense against these hell-spawned hordes. Prepare for the most intense mutant-laden, blood-splattered action ever!

es/mp html
programmers. Among its features
inting language.
ame time and blocks copied
languages / file formats: C, C++,
HTML
by the external utility
functions or variables inside
isually highlighted (underlined),
ed to avoid typing your own function
names over and over.
Intelligent help system: pressing F1 over any word of a text being edited
triggers the underlying system help (calling man) when editing C or Shell
- Understandable interface: drop-down menus, reasonable default key bindings.
- Configurable keys, menus and colors.
- Text templates can be easily defined / accessed.
- Multiplatform: Unix/Linux Curses, Qt4, GTK+, KDE4, MS Windows (both windowed
and console).
- Automatic indentation, word wrapping, internal spell, learning /
repeating functions.
- Spellchecking support (via the aspell package).
- Multilingual.
- Password-protected, encrypted text files (using the ARCFOUR algorithm).
- It helps you abandon vi, emacs and other six-legged freaks definitely.

README.md - Textadept (C:\Documents and Settings\Administrator\Desktop\textadept
Textadept
Overview
Textadept is a fast, minimalist, and remarkably extensible cross-platform
editor for programmers. Written in a combination of C and
and
relentlessly optimized for speed and minimalism over the years, Textadept
is ideal editor for programmers who want endless extensibility without sacri
speed or succumbing to code bloat and featuritis.
[Lua]
Features
* Self-contained executable - no installation necessary.
* Entirely keyboard driven.
* Unlimited split views.
* Support for over 80 programming languages.
* Powerful snippets and key commands.
* Code autocompletion and API lookup.
* Unparalleled extensibility.
* Terminal (curses) version.

Language Indenting and T
Introduction
Two of the most useful features of the Se
Support and Templates.
Language Support handles the formatting o
Support, you don't have to keep track of
useful for programmers who write a lot of
formatting.
In the standard configuration, the SemWar
programs as defined in "The C Programming
Ritchie. A standard piece of formatted c
if (a) {
s1();
}
Many people wish to modify this to use a
consistent and easier for some people to
out dented in a manner similar to Pascal'

is available on the SemWare web site
ion 2 Setting Environment Variables
ion 3 Test-Drive Software License
ion 4 Feature List
ion 5 Ordering Information
ion 6 Order Form
Overview
is is a Test Drive copy of TSE Pro, for EVALUATION PURPOSES
When you purchase a licensed copy of TSE Pro, you will be enti
to technical support and discounts on future versions.
To start the editor, click on the TSEPro icon, or type "q32" f
command prompt. You may need to update your path environment
variable to reference the directory the editor was installed i
you are running it from a command prompt.
The following functions are readily available in the editor by
pressing the indicated key:
Access the pull-down Menus [F10]
Context-sensitive Help [F1]
Display key assignments [Shift F1]
Exit the editor [Alt X]
(you will be prompted to save changed files)
If you change the Emulation, these functions will be assigned
appropriate keys for the selected Emulation.
Setting Environment Variables
To configure Windows XP so that TSE Pro can be started from a Co
Prompt (or so-called DOS box) without having to type the complet
path, do the following:

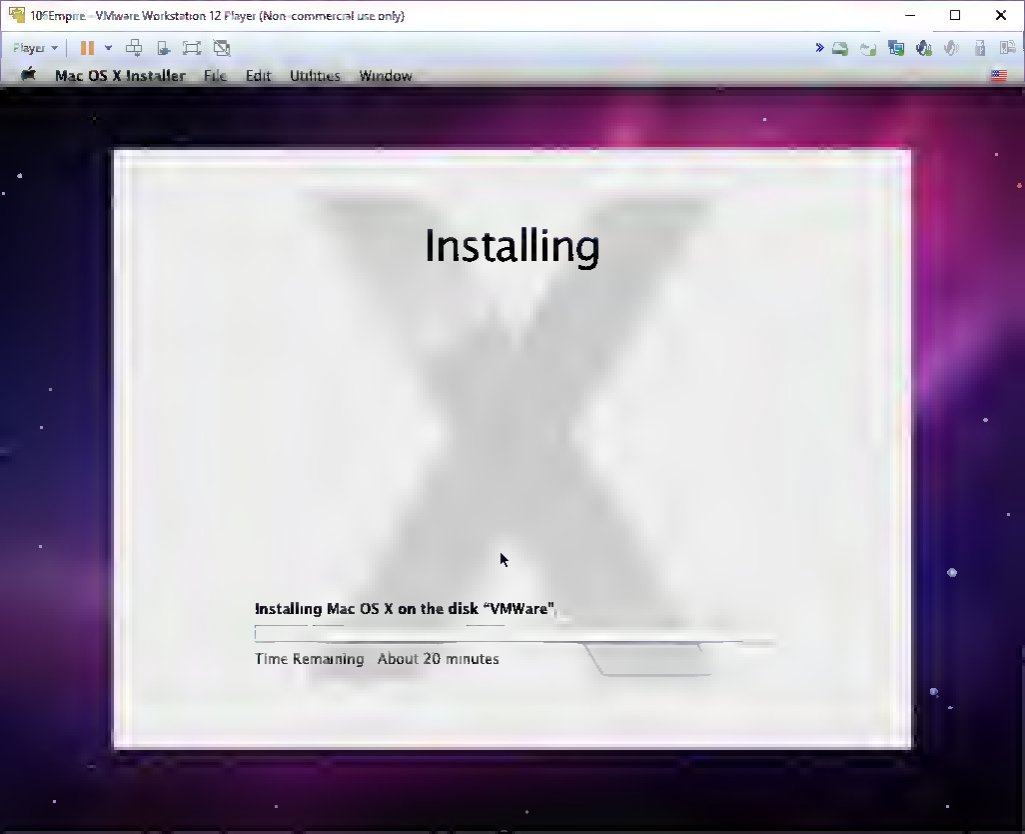

[No Name] VIM
VIM - Vi IMproved

Mac OS X Snow Leopard

[illegible] modernized operating system finally [illegible]

Refined from installation to shutdown

Mac OS X Snow Leopard enhances your entire Mac experience. Faster, more reliable and easier to use, the Mac you know and love made even better.

New core technologies

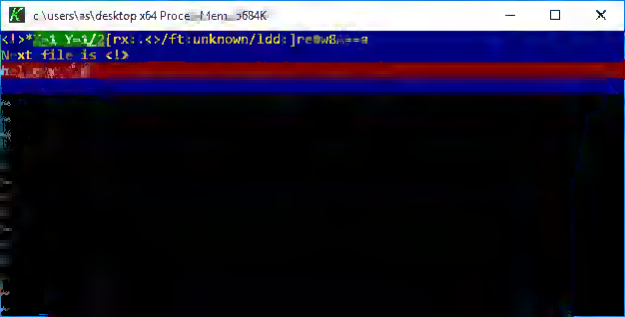

Snow Leopard is built for the future with 64-bit and 32-bit compatibility. Grand Central Dispatch optimizes multi-core performance. And OpenCL lets applications tap the power of your graphic processor.

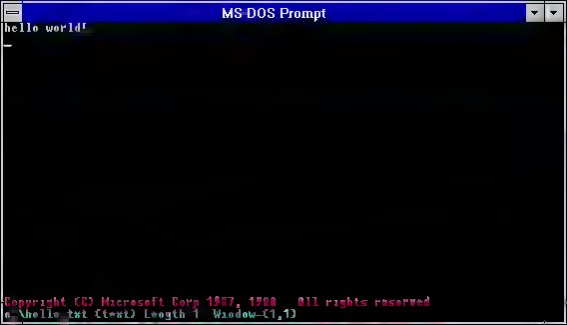

Support for Microsoft Exchange

Mac OS X Snow Leopard includes built-in support for Microsoft Exchange Server 2007 so you can use Mail, Cal and Address Book at home and at work.

UnixWare 2 sets new world record for database price performance in TPC-C benchmark test
The UnixWare 2/Compaq Sylvese absolute performance score of 1516.77 TPMs represents mainframe-class performance that surpasses many of the far more complex RISC servers in the marketplace. The new record reduces the cost per transaction from $440 to $319, representing a customer cost savings of 28.

In the 1980s, the BBC explored the world of home computing in a series of programmes called **The Computer Literacy Project**. They commissioned a home computer (the BBC Micro) and taught viewers how to program.

The Computer Literacy Project chronicled a decade of information technology and was a milestone in the history of computing in Britain, helping to inspire a generation of coders.

This site contains all 148 of the original Computer Literacy Project programmes plus 121 related programmes, broken down into 2,509 categorised, searchable clips.

- Watch any of the 267 programmes
- Explore 2,509 programme clips by topic or text search
- Find out how the BBC Computer Literacy Project came about
- Run 166 BBC Micro programmes that were used on-screen

Browse The Computer Literacy Project Archive

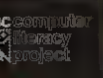

Programmes

Watch 148 programmes from the original Project series and 121 related programmes, including interviews with some of those involved.

Explore

Explore 20 recurring topics or search the contents of the 2,509 separate clips by keyword, curated by the original production team.

Project History

Find out how the Computer Literacy Project and the BBC Micro contributed to the history of computing in Britain.

BBC Micro Software

Run 166 software programs from the TV broadcasts on a BBC Micro emulator, finish the clips and even list and modify the programs.

Microsoft® OS/2 Presentation Manager Softset

Your Tool for Developing OS/2 Presentation Manager Applications

Create the next generation of personal computer applications with Microsoft OS/2 Presentation Manager Softset version 1.2. It's the most cost-effective way to begin developing graphical applications for the OS/2 Presentation Manager.

The OS/2 Presentation Manager provides a consistent graphical user interface that makes applications easy to learn and use. But developing applications for the OS/2 Presentation Manager can be a substantial investment in time and money. Microsoft OS/2 Presentation Manager Softset version 1.2 comes through on both counts—it provides an economical set of visually oriented development tools to help you create customized drop-down menus, dialog boxes, icons, and fonts. Combine the Softset with documentation and a language providing OS/2 support for a complete OS/2 version 1.2 development environment.

Under OS/2 systems, you can create more powerful applications than under DOS (MS-DOS® or PC DOS operating system). Applications that break the 640K barrier of DOS, using up to 16 MB of physical memory. You can make use of sophisticated interprocess-communication mechanisms. Use the protected mode of the 80286/80386 processors to write applications with multiple threads of execution. And create device-independent graphics—your program doesn't have to know which output device it's working with.

Developing for the OS/2 Presentation Manager—the next-generation personal-computer operating system—is serious business. Put your confidence in tools from Microsoft, the company that brought you MS® OS/2.

- New OS/2 version 1.2 features are supported, including long filenames and extended attributes.
- Dialog Box Editor lets you design dialog boxes.
- Icon Editor lets you create unique color icons, cursors, and bitmaps.
- Font Editor lets you create your own fonts.
- Resource Compiler lets you bind resource-definition files to .EXE files.
- Other tools and utilities help you create and maintain libraries, message files, and dual-mode (DOS-OS/2) programs.

System Requirements

- IBM® PC/AT®, PS/2® or compatible
- 2.5 MB memory
- MS OS/2 1.2 or higher or IBM OS/2 1.2 or higher
- One hard disk and one high-density disk drive
- A language with OS/2 support, such as Microsoft BASIC Compiler version 6.0, Microsoft C Optimizing Compiler version 5.1, Microsoft FORTRAN Optimizing Compiler version 5.0, Microsoft Macro Assembler version 5.1 or Microsoft Pascal Compiler version 4.0.

Note
Some tools require the use of a mouse or similar pointing device.

This package contains software and documentation for the tools only. The companion Microsoft OS/2 Programmer's Reference Library is available from Microsoft Press. Ask your dealer for details.

A week with the Microsoft Lumia 950

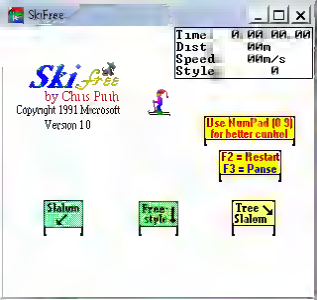

Posted on July 13, 2018 by neozeed

I'm a sucker for old / obsolete junk. I was looking through an electronic market, and was near some used cellphone vendors and I saw this little gem, the Microsoft (Nokia) Lumia 950. I used to have a Windows 8 phone back in 2013. I picked it up

Exit without completing Setup CONTROL+X

QEMU
SETUP PROGRAM for Microsoft Windows/386 Version 2.03
Setup prepares Windows/386 to run on your computer.
To run Setup you need to know the following:
* what kind of pointing device (mouse) you have, if any
* what kind of graphics adapter (display) you have
* what kind of printer(s) you have, if any
* which port your printer is connected to
To set up Windows/386 properly, you should complete the Setup program.
You can leave the Setup process by pressing CONTROL+X (press and hold
the CONTROL key, and press the X key). Please keep in mind that Setup will
not be completed and Windows/386 will not be installed on your computer.
WHEN YOU'RE READY TO PRESS
Continue Setup ENTER
Exit without completing Setup CONTROL+X

Information About New Features

Importing Graphics (pages 256-260)

Word for Windows can import graphics files other than TIFF graphics. The Setup program presents the list of graphics file formats, installs the necessary files, and modifies your WIN.INI file. If you acquire additional graphics file filters, you must insert a line in the [WWFilters] section of your WIN.INI that looks like this:

Windows Metafile=WMF,FLT,WMF

First, type the description of the filter, followed by an equal sign. Type the filter's file name, followed by a comma. Then type the file name extension for the graphics files. If you want to import one type of graphic format with two or more different file extensions, be sure to make the description of the filter unique. For example, if you plan to import HGL, CHT, and INV formats from Hewlett-Packard graphics language, you should make the entries in your WIN.INI file something like the following:

HPGL Filter=HPGLIMP,FLT,HGL
HP Graphics Chart Import=HPGLIMP,FLT,CHT
HP Graphics INV=HPGLIMP,FLT,INV

Note: If you do not have a printer driver attached to a physical port or to a file name, you will

Additional Information About Microsoft Word for Windows
Since the publication of the Microsoft Word for Windows User's Reference additional information has become available This document contains that information, organized into sections To see a particular section, use the table below At the end of many topic titles you will find a list of page numbers which refer to pages in the User's Reference on which the topic is described
For a list of
Double-click the box or select box and press Alt+Shift+F9
Important Information
Corrections to the User's Reference
Additional Printing Information
Additional Memory and Computer Configuration Information
Additions to the Sample Templates
To print this document
Information About New Features
Importing Graphics (pages 256–260)
Word for Windows can import graphics files other than TIFF graphics The Setup program presents the list of graphics file formats installs the necessary files and modifies your WIN INI file If you acquire additional graphics file filters you must insert a line in the [WWFilters] section of your WIN INI that looks like this
Windows Metafile=WMF FLT WMF
First, type the description of the filter followed by an equal sign Type the filter's file name followed by a comma Then type the file name extension for the graphics files If you want to import one type of graphic format with two or more different file extensions be sure to make the description of the filter unique For example if you plan to import HGL, CHT, and INV formats from Hewlett-Packard graphics language you should make the entries in your WIN INI file something like the following
TECHREF.DOC
Style: paragraph
This document is an abridged version of the Macros sections from the Technical Reference In your Word for Windows package you will find a form to fill out and mail in to purchase the Technical Reference
Macros: Introduction
A macro is a set of instructions that you can create for Microsoft Word to follow You can use a macro to combine a series of actions into one step Whenever you frequently repeat the same steps in Word it's likely that creating a macro to perform the task can save you some time and effort
You can use macros to configure and customize Word for many situations You can add and delete menu items move them around and assign commands to key combinations In some cases you may want to write special applications with Word Using fields macros and templates you can create a document processing system that meets your specific needs
The examples in this chapter highlight the programming possibilities available with Word Although these examples are simple, they show some of the basics with which you can create your own programs with Word
Writing a Macro
There are two ways to write a macro You can create a macro by recording keystrokes you make You can also write your macro by using the statements and functions of WordBASIC the Word macro language For more information on specific statements and functions see Macros Reference
Using Macro Record to Write a Macro
When you record a macro, you turn on the recorder and Word records all the actions you take until you turn off the recorder
